

Package ‘AllMetrics’

March 12, 2024

Type Package

Title Calculating Multiple Performance Metrics of a Prediction Model

Version 0.2.1

Author Dr. Sandip Garai [aut, cre]

Maintainer Dr. Sandip Garai <sandipnicksandy@gmail.com>

Description Provides a function to calculate multiple performance metrics for actual and predicted values. In total eight metrics will be calculated for particular actual and predicted series. Helps to describe a Statistical model's performance in predicting a data. Also helps to compare various models' performance. The metrics are Root Mean Squared Error (RMSE), Relative Root Mean Squared Error (RRMSE), Mean absolute Error (MAE), Mean absolute percentage error (MAPE), Mean Absolute Scaled Error (MASE), Nash-Sutcliffe Efficiency (NSE), Willmott's Index (WI), and Legates and McCabe Index (LME). Among them, first five are expected to be lesser whereas, the last three are greater the better. More details can be found from Garai and Paul (2023) <[doi:10.1016/j.iswa.2023.200202](https://doi.org/10.1016/j.iswa.2023.200202)> and Garai et al. (2024) <[doi:10.1007/s110024-11552-w](https://doi.org/10.1007/s110024-11552-w)>.

`all_metrics`*Calculating Multiple Performance Metrics of a Prediction Model*

Description

This provides a function to calculate multiple performance metrics for actual and predicted values.

Usage

```
all_metrics(actual, predicted)
```

Arguments

<code>actual</code>	This is the actual time series values
<code>predicted</code>	This is the predicted values of a time series using a model

Value

- AllMetrics - A data frame containing two columns with first column as the name of the eight metrics and second column as the corresponding values

Examples

```
actual <- c(1.5, 2.3, 25, 52, 14)
predicted <- c(1.2, 10, 3.5, 4.3, 5.6)
# Inside the function 1st specify actual then predicted
print(all_metrics(actual, predicted))
```
