

Package ‘SCpubr’

August 20, 2025

Type Package

Title Generate Publication Ready Visualizations of Single Cell
Transcriptomics Data

Version 3.0.0

Description A system that provides a streamlined way of generating publication ready plots for known Single-Cell transcriptomics data in a “publication ready” format. This is, the goal is to automatically generate plots with the highest quality possible, that can be used right away or with minimal modifications for a research article.

do_ActivityHeatmap *Compute affinity of gene sets to cell populations using decoupleR.*

Description

Major contributions to this function:

- **Marc Elosua Bayés** for the core concept code and idea.
- **Pau Badia i Mompel** for the network generation.

Usage

```
do_ActivityHeatmap(  
  sample,  
  input_gene_list,  
  subsample = 2500,  
  group.by = NULL,  
  assay = NULL,  
  slot = NULL,  
  statistic = "ulm",  
  number.breaks = 5,  
  values.show = FALSE,  
  values.threshold = NULL,  
  values.size = 3,  
  values.round = 1,  
  use_viridis = FALSE,  
  viridis.palette = "G",  
  viridis.direction = -1,  
  sequential.palette = "YlGnBu",  
  sequential.direction = 1,  
  diverging.palette = "RdBu",  
  diverging.direction = -1,  
  enforce_symmetry = TRUE,  
  legend.position = "bottom",  
  legend.width = 1,  
  legend.length = 20,  
  legend.framewidth = 0.5,  
  legend.tickwidth = 0.5,  
  legend.framecolor = "grey50",  
  legend.tickcolor = "white",  
  legend.type = "colorbar",  
  na.value = "grey75",  
  font.size = 14,  
  font.type = "sans",  
  axis.text.x.angle = 45,  
  flip = FALSE,  
  colors.use = NULL,
```

```

min.cutoff = NA,
max.cutoff = NA,
verbose = TRUE,
return_object = FALSE,
grid.color = "white",
border.color = "black",

)

```

Arguments

sample	<code>Seurat</code> A Seurat object, generated by CreateSeuratObject .
input_gene_list	<code>named_list</code> Named list of lists of genes to be used as input.
subsample	<code>numeric</code> Number of cells to subset for the analysis. NA will use all. Cells are selected at random.
group.by	<code>character</code> Metadata variable to group the output by. Has to be a character or factor column.
assay	<code>character</code> Assay to use. Defaults to the current assay.
slot	<code>character</code> Data slot to use. Only one of: counts, data, scale.data. Defaults to "data".
statistic	<code>character</code> DecoupleR statistic to use for the analysis. values in the Idents of the Seurat object are reported, assessing how specific a given gene set is for a given cell population compared to other gene sets of equal expression.
number.breaks	<code>numeric</code> Controls the number of breaks in continuous color scales of ggplot2-based plots.
values.show	<code>logical</code> Whether to add values as text in the heatmap.
values.threshold	<code>numeric</code> Value from which the text color turns from black to white. If mode = "hvg", this is applied to both ends of the color scale.
values.size	<code>numeric</code> Size of the text labels.
values.round	<code>numeric</code> Decimal to which round the values to.
use_viridis	<code>logical</code> Whether to use viridis color scales.
viridis.palette	<code>character</code> A capital letter from A to H or the scale name as in scale_fill_viridis .

```

viridis.direction
    numeric | Either 1 or -1. Controls how the gradient of viridis scale is formed.

sequential.palette
    character | Type of sequential color palette to use. Out of the sequential
    palettes defined in brewer.pal.

sequential.direction
    numeric | Direction of the sequential color scale. Either 1 or -1.

diverging.palette
    character | Type of symmetrical color palette to use. Out of the diverging
    palettes defined in brewer.pal.

diverging.direction
    numeric | Either 1 or -1. Direction of the diverging palette. This basically flips
    the two ends.

enforce_symmetry
    logical | Return a symmetrical plot axes-wise or continuous color scale-wise,
    when applicable.

legend.position
    character | Position of the legend in the plot. One of:
        • top: Top of the figure.
        • bottom: Bottom of the figure.
        • left: Left of the figure.
        • right: Right of the figure.
        • none: No legend is displayed.

legend.length, legend.width
    numeric | Length and width of the legend. Will adjust automatically depending
    on legend side.

legend.framewidth, legend.tickwidth
    numeric | Width of the lines of the box in the legend.

legend.framecolor
    character | Color of the lines of the box in the legend.

legend.tickcolor
    character | Color of the ticks of the box in the legend.

legend.type
    character | Type of legend to display. One of:
        • normal: Default legend displayed by ggplot2.
        • colorbar: Redefined colorbar legend, using guide\_colorbar.

na.value
    character | Color value for NA.

font.size
    numeric | Overall font size of the plot. All plot elements will have a size relationship
    with this font size.

font.type
    character | Base font family for the plot. One of:
        • mono: Mono spaced font.
        • serif: Serif font family.
        • sans: Default font family.

axis.text.x.angle
    numeric | Degree to rotate the X labels. One of: 0, 45, 90.

```

<code>flip</code>	<code>logical</code> Whether to invert the axis of the displayed plot.
<code>colors.use</code>	<code>named_vector</code> Named vector of valid color representations (either name of HEX codes) with as many named colors as unique values of <code>group.by</code> . If <code>group.by</code> is not provided, defaults to the unique values of <code>Idents</code> . If not provided, a color scale will be set by default.
<code>min.cutoff, max.cutoff</code>	<code>numeric</code> Set the min/max ends of the color scale. Any cell/group with a value lower than <code>min.cutoff</code> will turn into <code>min.cutoff</code> and any cell with a value higher than <code>max.cutoff</code> will turn into <code>max.cutoff</code> . In FeaturePlots, provide as many values as features. Use NAs to skip a feature.
<code>verbose</code>	<code>logical</code> Whether to show extra comments, warnings,etc.
<code>return_object</code>	<code>logical</code> Returns the Seurat object with the modifications performed in the function. Nomally, this contains a new assay with the data that can then be used for any other visualization desired.
<code>grid.color</code>	<code>character</code> Color of the grid in the plot. In heatmaps, color of the border of the cells.
<code>border.color</code>	<code>character</code> Color for the border of the heatmap body.
<code>flavor</code>	<code>character</code> One of: Seurat, UCell. Compute the enrichment scores using <code>AddModuleScore</code> or <code>AddModuleScore_UCell</code> .
<code>nbin</code>	<code>numeric</code> Number of bins to use in <code>AddModuleScore</code> .
<code>ctrl</code>	<code>numeric</code> Number of genes in the control set to use in <code>AddModuleScore</code> .
<code>plot.title.face, plot.subtitle.face, plot.caption.face,</code> <code>axis.title.face, axis.text.face, legend.title.face, legend.text.face</code>	<code>character</code> Controls the style of the font for the corresponding theme element. One of: <ul style="list-style-type: none"> • <code>plain</code>: For normal text. • <code>italic</code>: For text in italic. • <code>bold</code>: For text in bold. • <code>bold.italic</code>: For text both in italic and bold.

Value

A list containing different plots.

Examples

```
# Check Suggests.
value <- SCpubr:::check_suggests(function_name = "do_ActivityHeatmap", passive = TRUE)

if (isTRUE(value)){
  # Consult the full documentation in https://enblacar.github.io/SCpubr-book/
  # Define your Seurat object.
  sample <- readRDS(system.file("extdata/seurat_dataset_example.rds", package = "SCpubr"))

  # Genes have to be unique.
```

```

genes <- list("A" = rownames(sample)[1:5],
              "B" = rownames(sample)[6:10],
              "C" = rownames(sample)[11:15])

# Default parameters.
p <- SCpubr::do_ActivityHeatmap(sample = sample,
                                   input_gene_list = genes,
                                   nbin = 1,
                                   ctrl = 5,
                                   flavor = "Seurat",
                                   subsample = NA,
                                   verbose = FALSE)

p

} else if (base::isFALSE(value)){
  message("This function can not be used without its suggested packages.")
  message("Check out which ones are needed using `SCpubr::state_dependencies()`")
}

```

do_AlluvialPlot *Generate Alluvial plots.*

Description

This function is based on the **ggalluvial** package. It allows you to generate alluvial plots from a given Seurat object.

Usage

```

do_AlluvialPlot(
  sample,
  first_group,
  last_group,
  middle_groups = NULL,
  colors.use = NULL,
  colorblind = FALSE,
  plot.title = NULL,
  plot.subtitle = NULL,
  plot.caption = NULL,
  font.size = 14,
  font.type = "sans",
  xlab = NULL,
  ylab = "Number of cells",
  repel = FALSE,
  fill.by = last_group,
  use_labels = FALSE,
  stratum.color = "black",

```

```

stratum.fill = "white",
stratum.width = 1/3,
stratum.fill.conditional = FALSE,
use_geom_flow = FALSE,
alluvium.color = "white",
flow.color = "white",
flip = FALSE,
label.color = "black",
curve_type = "sigmoid",
use_viridis = FALSE,
viridis.palette = "G",
viridis.direction = -1,
sequential.palette = "YlGnBu",
sequential.direction = 1,
plot.grid = FALSE,
grid.color = "grey75",
grid.type = "dashed",
na.value = "white",
legend.position = "bottom",
legend.title = NULL,
plot.title.face = "bold",
plot.subtitle.face = "plain",
plot.caption.face = "italic",
axis.title.face = "bold",
axis.text.face = "plain",
legend.title.face = "bold",
legend.text.face = "plain"
)

```

Arguments

sample	<code>Seurat</code> A Seurat object, generated by CreateSeuratObject .
first_group	<code>character</code> Categorical metadata variable. First group of nodes of the alluvial plot.
last_group	<code>character</code> Categorical metadata variable. Last group of nodes of the alluvial plot.
middle_groups	<code>character</code> Categorical metadata variable. Vector of groups of nodes of the alluvial plot.
colors.use	<code>character</code> Named list of colors corresponding to the unique values in fill.by (which defaults to last_group).
colorblind	<code>logical</code> Whether to use colorblind-friendly colors for categorical variables. In place when colors.use is not used. Allows for a maximum of 85 different classes within a categorical variable.
plot.title, plot.subtitle, plot.caption	<code>character</code> Title, subtitle or caption to use in the plot.
font.size	<code>numeric</code> Overall font size of the plot. All plot elements will have a size relationship with this font size.

<code>font.type</code>	<code>character</code> Base font family for the plot. One of:
	<ul style="list-style-type: none"> • <code>mono</code>: Mono spaced font. • <code>serif</code>: Serif font family. • <code>sans</code>: Default font family.
<code>xlab, ylab</code>	<code>character</code> Titles for the X and Y axis.
<code>repel</code>	<code>logical</code> Whether to repel the text labels.
<code>fill.by</code>	<code>character</code> One of <code>first_group</code> , <code>middle_groups</code> (one of the values, if multiple <code>mid_groups</code>) or <code>last_group</code> . These values will be used to color the alluvium/flow.
<code>use_labels</code>	<code>logical</code> Whether to use labels instead of text for the stratum.
<code>stratum.color, alluvium.color, flow.color</code>	<code>character</code> Color for the border of the alluvium (and flow) and stratum.
<code>stratum.fill</code>	<code>character</code> Color to fill the stratum.
<code>stratum.width</code>	<code>logical</code> Width of the stratum.
<code>stratum.fill.conditional</code>	<code>logical</code> Whether to fill the stratum with the same colors as the alluvium/flow.
<code>use_geom_flow</code>	<code>logical</code> Whether to use <code>geom_flow</code> instead of <code>geom_alluvium</code> . Visual results might differ.
<code>flip</code>	<code>logical</code> Whether to invert the axis of the displayed plot.
<code>label.color</code>	<code>character</code> Color for the text labels.
<code>curve_type</code>	<code>character</code> Type of curve used in <code>geom_alluvium</code> . One of:
	<ul style="list-style-type: none"> • <code>linear</code>. • <code>cubic</code>. • <code>quintic</code>. • <code>sine</code>. • <code>arctangent</code>. • <code>sigmoid</code>. • <code>xspline</code>.
<code>use_viridis</code>	<code>logical</code> Whether to use viridis color scales.
<code>viridis.palette</code>	<code>character</code> A capital letter from A to H or the scale name as in <code>scale_fill_viridis</code> .
<code>viridis.direction</code>	<code>numeric</code> Either 1 or -1. Controls how the gradient of viridis scale is formed.
<code>sequential.palette</code>	<code>character</code> Type of sequential color palette to use. Out of the sequential palettes defined in <code>brewer.pal</code> .
<code>sequential.direction</code>	<code>numeric</code> Direction of the sequential color scale. Either 1 or -1.
<code>plot.grid</code>	<code>logical</code> Whether to plot grid lines.
<code>grid.color</code>	<code>character</code> Color of the grid in the plot. In heatmaps, color of the border of the cells.
<code>grid.type</code>	<code>character</code> One of the possible linetype options:

- blank.
- solid.
- dashed.
- dotted.
- dotdash.
- longdash.
- twodash.

`na.value` **character** | Color value for NA.

`legend.position`

character | Position of the legend in the plot. One of:

- top: Top of the figure.
- bottom: Bottom of the figure.
- left: Left of the figure.
- right: Right of the figure.
- none: No legend is displayed.

`legend.title` **character** | Title for the legend.

`plot.title.face`, `plot.subtitle.face`, `plot.caption.face`,
`axis.title.face`, `axis.text.face`, `legend.title.face`, `legend.text.face`

character | Controls the style of the font for the corresponding theme element.

One of:

- plain: For normal text.
- italic: For text in italic.
- bold: For text in bold.
- bold.italic: For text both in italic and bold.

Value

A ggplot2 object.

Examples

```
# Check Suggests.
value <- SCpubr:::check_suggests(function_name = "do_AlluvialPlot", passive = TRUE)
message(value)
if (isTRUE(value)){
  # Consult the full documentation in https://enblacar.github.io/SCpubr-book/
  # Define your Seurat object.
  sample <- readRDS(system.file("extdata/seurat_dataset_example.rds", package = "SCpubr"))

  # Compute basic sankey plot.
  p <- SCpubr:::do_AlluvialPlot(sample = sample,
                                 first_group = "orig.ident",
                                 last_group = "seurat_clusters")

} else if (base:::isFALSE(value)){
  message("This function can not be used without its suggested packages.")
```

```
    message("Check out which ones are needed using `SCpubr::state_dependencies()`")
}
```

do_BarPlot*Create Bar Plots.*

Description

Create Bar Plots.

Usage

```
do_BarPlot(
  sample,
  group.by,
  order = FALSE,
  add.n = FALSE,
  add.n.face = "bold",
  add.n.expand = c(0, 1.15),
  add.n.size = 4,
  order.by = NULL,
  split.by = NULL,
  facet.by = NULL,
  position = "stack",
  font.size = 14,
  font.type = "sans",
  legend.position = "bottom",
  legend.title = NULL,
  legend.ncol = NULL,
  legend.nrow = NULL,
  legend.byrow = FALSE,
  axis.text.x.angle = 45,
  xlab = NULL,
  ylab = NULL,
  colors.use = NULL,
  colorblind = FALSE,
  flip = FALSE,
  plot.title = NULL,
  plot.subtitle = NULL,
  plot.caption = NULL,
  plot.grid = FALSE,
  grid.color = "grey75",
  grid.type = "dashed",
  plot.title.face = "bold",
  plot.subtitle.face = "plain",
  plot.caption.face = "italic",
```

```

axis.title.face = "bold",
axis.text.face = "plain",
legend.title.face = "bold",
legend.text.face = "plain",
strip.text.face = "bold",
return_data = FALSE
)

```

Arguments

<code>sample</code>	<code>Seurat</code> A Seurat object, generated by CreateSeuratObject .
<code>group.by</code>	<code>character</code> Metadata column to compute the counts of. Has to be either a character or factor column.
<code>order</code>	<code>logical</code> Whether to order the results in descending order of counts.
<code>add.n</code>	<code>logical</code> Whether to add the total counts on top of each bar.
<code>add.n.face</code>	<code>character</code> Font face of the labels added by <code>add.n</code> .
<code>add.n.expand</code>	<code>numeric</code> Vector of two numerics representing the start and end of the scale. Minimum should be 0 and max should be above 1. This basically expands the Y axis so that the labels fit when <code>flip = TRUE</code> . <ul style="list-style-type: none"> • <code>stack</code>: Set the bars side by side, displaying the total number of counts. Uses position_stack. • <code>fill</code>: Set the bars on top of each other, displaying the proportion of counts from the total that each group represents. Uses position_fill.
<code>add.n.size</code>	<code>numeric</code> Size of the labels
<code>order.by</code>	<code>character</code> When <code>split.by</code> is used, value of <code>group.by</code> to reorder the columns based on its value.
<code>split.by</code>	<code>character</code> Metadata column to split the values of <code>group.by</code> by. If not used, defaults to the active idents.
<code>facet.by</code>	<code>character</code> Metadata column to gather the columns by. This is useful if you have other overarching metadata.
<code>position</code>	<code>character</code> Position function from ggplot2 . Either stack or fill.
<code>font.size</code>	<code>numeric</code> Overall font size of the plot. All plot elements will have a size relationship with this font size.
<code>font.type</code>	<code>character</code> Base font family for the plot. One of: <ul style="list-style-type: none"> • <code>mono</code>: Mono spaced font. • <code>serif</code>: Serif font family. • <code>sans</code>: Default font family.
<code>legend.position</code>	<code>character</code> Position of the legend in the plot. One of: <ul style="list-style-type: none"> • <code>top</code>: Top of the figure. • <code>bottom</code>: Bottom of the figure. • <code>left</code>: Left of the figure. • <code>right</code>: Right of the figure.

	<ul style="list-style-type: none"> • none: No legend is displayed.
legend.title	<code>character</code> Title for the legend.
legend.ncol	<code>numeric</code> Number of columns in the legend.
legend.nrow	<code>numeric</code> Number of rows in the legend.
legend.byrow	<code>logical</code> Whether the legend is filled by row or not.
axis.text.x.angle	<code>numeric</code> Degree to rotate the X labels. One of: 0, 45, 90.
xlab, ylab	<code>character</code> Titles for the X and Y axis.
colors.use	<code>named_vector</code> Named vector of valid color representations (either name of HEX codes) with as many named colors as unique values of group_by. If group_by is not provided, defaults to the unique values of <code>Idents</code> . If not provided, a color scale will be set by default.
colorblind	<code>logical</code> Whether to use colorblind-friendly colors for categorical variables. In place when <code>colors.use</code> is not used. Allows for a maximum of 85 different classes within a categorical variable.
flip	<code>logical</code> Whether to invert the axis of the displayed plot.
plot.title, plot.subtitle, plot.caption	<code>character</code> Title, subtitle or caption to use in the plot.
plot.grid	<code>logical</code> Whether to plot grid lines.
grid.color	<code>character</code> Color of the grid in the plot. In heatmaps, color of the border of the cells.
grid.type	<code>character</code> One of the possible linetype options: <ul style="list-style-type: none"> • blank. • solid. • dashed. • dotted. • dotdash. • longdash. • twodash.
plot.title.face, axis.title.face, axis.text.face, legend.title.face, legend.text.face	<code>character</code> Controls the style of the font for the corresponding theme element. One of: <ul style="list-style-type: none"> • plain: For normal text. • italic: For text in italic. • bold: For text in bold. • bold.italic: For text both in italic and bold.
strip.text.face	<code>character</code> Controls the style of the font for the strip text. One of: <ul style="list-style-type: none"> • plain: For normal text. • italic: For text in italic. • bold: For text in bold. • bold.italic: For text both in italic and bold.
return_data	<code>logical</code> Returns a data.frame with the count and proportions displayed in the plot.

Value

A ggplot2 object containing a Bar plot.

Examples

```
# Check Suggests.
value <- SCpubr:::check_suggests(function_name = "do_BeeSwarmPlot", passive = TRUE)

if (isTRUE(value)){
  # Consult the full documentation in https://enblacar.github.io/SCpubr-book/
  # Define your Seurat object.
  sample <- readRDS(system.file("extdata/seurat_dataset_example.rds", package = "SCpubr"))

  # Basic bar plot, horizontal.
  p1 <- SCpubr:::do_BeeSwarmPlot(sample = sample,
                                    group_by = "seurat_clusters",
                                    legend.position = "none",
                                    plot.title = "Number of cells per cluster")

  # Split by a second variable.
  sample$modified_orig.ident <- sample(x = c("Sample_A", "Sample_B", "Sample_C"),
                                         size = ncol(sample),
                                         replace = TRUE,
                                         prob = c(0.2, 0.7, 0.1))

Arguments

sample	<code>Seurat</code> A Seurat object, generated by CreateSeuratObject .
feature_to_rank	<code>character</code> Feature for which the cells are going to be ranked. Ideal case is that this feature is stored as a metadata column.
group.by	<code>character</code> Metadata variable to group the output by. Has to be a character or factor column.
assay	<code>character</code> Assay to use. Defaults to the current assay.
reduction	<code>character</code> Reduction to use. Can be the canonical ones such as "umap", "pca", or any custom ones, such as "diffusion". If you are unsure about which reductions you have, use <code>Seurat::Reductions(sample)</code> . Defaults to "umap" if present or to the last computed reduction if the argument is not provided.
slot	<code>character</code> Data slot to use. Only one of: counts, data, scale.data. Defaults to "data".
continuous_feature	<code>logical</code> Is the feature to rank and color for continuous? I.e: an enrichment score.
order	<code>logical</code> Whether to reorder the groups based on the median of the ranking.
colors.use	<code>named_vector</code> Named vector of valid color representations (either name of HEX codes) with as many named colors as unique values of <code>group.by</code> . If <code>group.by</code> is not provided, defaults to the unique values of Idents . If not provided, a color scale will be set by default.
colorblind	<code>logical</code> Whether to use colorblind-friendly colors for categorical variables. In place when <code>colors.use</code> is not used. Allows for a maximum of 85 different classes within a categorical variable.
legend.title	<code>character</code> Title for the legend.
legend.type	<code>character</code> Type of legend to display. One of: <ul style="list-style-type: none"> • <code>normal</code>: Default legend displayed by ggplot2. • <code>colorbar</code>: Redefined colorbar legend, using guide_colorbar.
legend.position	<code>character</code> Position of the legend in the plot. One of: <ul style="list-style-type: none"> • <code>top</code>: Top of the figure. • <code>bottom</code>: Bottom of the figure.

- `left`: Left of the figure.
- `right`: Right of the figure.
- `none`: No legend is displayed.

`legend.framewidth, legend.tickwidth`
`numeric` | Width of the lines of the box in the legend.

`legend.length, legend.width`
`numeric` | Length and width of the legend. Will adjust automatically depending on legend side.

`legend.framecolor`
`character` | Color of the lines of the box in the legend.

`legend.tickcolor`
`character` | Color of the ticks of the box in the legend.

`legend.ncol` `numeric` | Number of columns in the legend.

`legend.icon.size`
`numeric` | Size of the icons in legend.

`plot.title, plot.subtitle, plot.caption`
`character` | Title, subtitle or caption to use in the plot.

`xlab, ylab` `character` | Titles for the X and Y axis.

`font.size` `numeric` | Overall font size of the plot. All plot elements will have a size relationship with this font size.

`font.type` `character` | Base font family for the plot. One of:

- `mono`: Mono spaced font.
- `serif`: Serif font family.
- `sans`: Default font family.

`remove_x_axis, remove_y_axis`
`logical` | Remove X axis labels and ticks from the plot.

`flip` `logical` | Whether to invert the axis of the displayed plot.

`use_viridis` `logical` | Whether to use viridis color scales.

`viridis.palette`
`character` | A capital letter from A to H or the scale name as in `scale_fill_viridis`.

`viridis.direction`
`numeric` | Either 1 or -1. Controls how the gradient of viridis scale is formed.

`sequential.palette`
`character` | Type of sequential color palette to use. Out of the sequential palettes defined in `brewer.pal`.

`sequential.direction`
`numeric` | Direction of the sequential color scale. Either 1 or -1.

`verbose` `logical` | Whether to show extra comments, warnings,etc.

`raster` `logical` | Whether to raster the resulting plot. This is recommendable if plotting a lot of cells.

`raster.dpi` `numeric` | Pixel resolution for rasterized plots. Defaults to 1024. Only activates on Seurat versions higher or equal than 4.1.0.

```
plot_cell_borders
  logical | Whether to plot border around cells.
border.size      numeric | Width of the border of the cells.
border.color     character | Color for the border of the heatmap body.
pt.size          numeric | Size of the dots.
min.cutoff, max.cutoff
  numeric | Set the min/max ends of the color scale. Any cell/group with a value
  lower than min.cutoff will turn into min.cutoff and any cell with a value higher
  than max.cutoff will turn into max.cutoff. In FeaturePlots, provide as many
  values as features. Use NAs to skip a feature.
na.value         character | Color value for NA.
number.breaks   numeric | Controls the number of breaks in continuous color scales of ggplot2-
  based plots.
plot.title.face,       plot.subtitle.face,       plot.caption.face,
axis.title.face, axis.text.face, legend.title.face, legend.text.face
  character | Controls the style of the font for the corresponding theme element.
One of:
  • plain: For normal text.
  • italic: For text in italic.
  • bold: For text in bold.
  • bold.italic: For text both in italic and bold.
```

Value

A ggplot2 object containing a Bee Swarm plot.

Examples

```
        group.by = "seurat_clusters",
        continuous_feature = TRUE)
} else if (base::isFALSE(value)){
  message("This function can not be used without its suggested packages.")
  message("Check out which ones are needed using `SCpubr::state_dependencies()`")
}
```

do_BoxPlot*Generate Box Plots.*

Description

Generate Box Plots.

Usage

```
do_BoxPlot(
  sample,
  feature,
  group.by = NULL,
  split.by = NULL,
  assay = NULL,
  slot = "data",
  font.size = 14,

  legend.title.position = "top",
  legend.position = "bottom",
  legend.ncol = NULL,
  legend.nrow = NULL,
  legend.byrow = FALSE,
  boxplot.line.color = "black",
  outlier.color = "black",
  outlier.alpha = 0.5,
  boxplot.linewidth = 0.5,
  boxplot.width = NULL,
  plot.grid = TRUE,
```

```

grid.color = "grey75",
grid.type = "dashed",
flip = FALSE,
order = FALSE,
use_silhouette = FALSE,
use_test = FALSE,
comparisons = NULL,
test = "wilcox.test",
map_signif_level = c(`***` = 0.001, `**` = 0.01, `*` = 0.05),
plot.title.face = "bold",
plot.subtitle.face = "plain",
plot.caption.face = "italic",
axis.title.face = "bold",
axis.text.face = "plain",
legend.title.face = "bold",
legend.text.face = "plain"
)

```

Arguments

sample	<code>Seurat</code> A Seurat object, generated by CreateSeuratObject .
feature	<code>character</code> Feature to represent.
group.by	<code>character</code> Metadata variable to group the output by. Has to be a character of factor column.
split.by	<code>character</code> Secondary metadata variable to further group (split) the output by. Has to be a character of factor column.
assay	<code>character</code> Assay to use. Defaults to the current assay.
slot	<code>character</code> Data slot to use. Only one of: counts, data, scale.data. Defaults to "data".
font.size	<code>numeric</code> Overall font size of the plot. All plot elements will have a size relationship with this font size.
font.type	<code>character</code> Base font family for the plot. One of: <ul style="list-style-type: none"> • <code>mono</code>: Mono spaced font. • <code>serif</code>: Serif font family. • <code>sans</code>: Default font family.
axis.text.x.angle	<code>numeric</code> Degree to rotate the X labels. One of: 0, 45, 90.
colors.use	<code>named_vector</code> Named vector of valid color representations (either name of HEX codes) with as many named colors as unique values of group.by. If group.by is not provided, defaults to the unique values of Idents . If not provided, a color scale will be set by default.
colorblind	<code>logical</code> Whether to use colorblind-friendly colors for categorical variables. In place when colors.use is not used. Allows for a maximum of 85 different classes within a categorical variable.
na.value	<code>character</code> Color value for NA.

```

plot.title, plot.subtitle, plot.caption
  character | Title, subtitle or caption to use in the plot.

xlab, ylab    character | Titles for the X and Y axis.

legend.title   character | Title for the legend.

legend.title.position
  character | Position for the title of the legend. One of:
  • top: Top of the legend.
  • bottom: Bottom of the legend.
  • left: Left of the legend.
  • right: Right of the legend.

legend.position
  character | Position of the legend in the plot. One of:
  • top: Top of the figure.
  • bottom: Bottom of the figure.
  • left: Left of the figure.
  • right: Right of the figure.
  • none: No legend is displayed.

legend.ncol    numeric | Number of columns in the legend.

legend.nrow    numeric | Number of rows in the legend.

legend.byrow   logical | Whether the legend is filled by row or not.

boxplot.line.color
  character | Color of the borders of the boxplots if use_silhouette is FALSE.

outlier.color   character | Color of the outlier dots.

outlier.alpha   numeric | Alpha applied to the outliers.

boxplot.linewidth
  numeric | Width of the lines in the boxplots. Also controls the lines of the tests
  applied if use_test is set to true.

boxplot.width   numeric | Width of the boxplots.

plot.grid      logical | Whether to plot grid lines.

grid.color     character | Color of the grid in the plot. In heatmaps, color of the border of the
  cells.

grid.type      character | One of the possible linetype options:
  • blank.
  • solid.
  • dashed.
  • dotted.
  • dotdash.
  • longdash.
  • twodash.

flip           logical | Whether to invert the axis of the displayed plot.

```

order	<code>logical</code> Whether to order the boxplots by average values. Can not be used alongside <code>split.by</code> .
use_silhouette	<code>logical</code> Whether to color the borders of the boxplots instead of the inside area.
use_test	<code>logical</code> Whether to apply a statistical test to a given pair of elements. Can not be used alongside <code>split.by</code> .
comparisons	A list of length-2 vectors. The entries in the vector are either the names of 2 values on the x-axis or the 2 integers that correspond to the index of the columns of interest.
test	the name of the statistical test that is applied to the values of the 2 columns (e.g. <code>t.test</code> , <code>wilcox.test</code> etc.). If you implement a custom test make sure that it returns a list that has an entry called <code>p.value</code> .
map_signif_level	Boolean value, if the p-value are directly written as annotation or asterisks are used instead. Alternatively one can provide a named numeric vector to create custom mappings from p-values to annotation: For example: <code>c("***=0.001, **=0.01, *=0.05)</code> . Alternatively, one can provide a function that takes a numeric argument (the p-value) and returns a string.
plot.title.face, axis.title.face, axis.text.face, legend.title.face, legend.text.face	<code>character</code> Controls the style of the font for the corresponding theme element. One of: <ul style="list-style-type: none"> • <code>plain</code>: For normal text. • <code>italic</code>: For text in italic. • <code>bold</code>: For text in bold. • <code>bold.italic</code>: For text both in italic and bold.

Value

A ggplot2 object.

Examples

```
# Check Suggests.
value <- SCpubr:::check_suggests(function_name = "do_BoxPlot", passive = TRUE)

if (isTRUE(value)){
  # Consult the full documentation in https://enblacar.github.io/SCpubr-book/

  # Define your Seurat object.

                        use_test = TRUE,
                        comparisons = list(c("A", "B")))
p

} else if (base::isFALSE(value)){
  message("This function can not be used without its suggested packages.")
  message("Check out which ones are needed using `SCpubr::state_dependencies()`")
}

```

do_CellularStatesPlot *Cellular States plot.*

Description

This plot aims to show the relationships between distinct enrichment scores. If 3 variables are provided, the relationship is between the Y axis and the dual X axis. If 4 variables are provided, each corner of the plot represents how enriched the cells are in that given list. How to interpret this? In a 3-variable plot, the Y axis just means one variable. The higher the cells are in the Y axis the more enriched they are in that given variable. The X axis is a dual parameter one. Cells falling into each extreme of the axis are highly enriched for either x1 or x2, while cells falling in between are not enriched for any of the two. In a 4-variable plot, each corner shows the enrichment for one of the 4 given features. Cells will tend to locate in either of the four corners, but there will be cases of cells locating mid-way between two given corners (enriched in both features) or in the middle of the plot (not enriched for any).

Usage

```
do_CellularStatesPlot(  
  sample,  
  input_gene_list,  
  x1,  
  y1,  
  x2 = NULL,  
  y2 = NULL,

    legend.text.face = "plain"
)

```

Arguments

sample	Seurat A Seurat object, generated by CreateSeuratObject .
input_gene_list	named_list Named list of lists of genes to be used as input.
x1	character A name of a list from input_gene_list. First feature in the X axis. Will go on the right side of the X axis if y2 is not provided and top-right quadrant if provided.
y1	character A name of a list from input_gene_list. First feature on the Y axis. Will become the Y axis if y2 is not provided and bottom-right quadrant if provided.
x2	character A name of a list from input_gene_list. Second feature on the X axis. Will go on the left side of the X axis if y2 is not provided and top-left quadrant if provided.
y2	character A name of a list from input_gene_list. Second feature on the Y axis. Will become the bottom-left quadrant if provided.
group.by	character Metadata variable to group the output by. Has to be a character or factor column.
colors.use	named_vector Named vector of valid color representations (either name of HEX codes) with as many named colors as unique values of group.by. If group.by is not provided, defaults to the unique values of Idents . If not provided, a color scale will be set by default.
colorblind	logical Whether to use colorblind-friendly colors for categorical variables. In place when colors.use is not used. Allows for a maximum of 85 different classes within a categorical variable.
legend.position	character Position of the legend in the plot. One of: <ul style="list-style-type: none"> • top: Top of the figure. • bottom: Bottom of the figure. • left: Left of the figure. • right: Right of the figure. • none: No legend is displayed.
legend.icon.size	numeric Size of the icons in legend.
legend.ncol	numeric Number of columns in the legend.
legend.nrow	numeric Number of rows in the legend.

legend.byrow **logical** | Whether the legend is filled by row or not.
 plot.title, plot.subtitle, plot.caption
 character | Title, subtitle or caption to use in the plot.
 font.size **numeric** | Overall font size of the plot. All plot elements will have a size relationship with this font size.
 font.type **character** | Base font family for the plot. One of:

- mono: Mono spaced font.
- serif: Serif font family.
- sans: Default font family.

 xlab, ylab **character** | Titles for the X and Y axis.
 axis.ticks **logical** | Whether to show axis ticks.
 axis.text **logical** | Whether to show axis text.
 verbose **logical** | Whether to show extra comments, warnings,etc.
 enforce_symmetry
 logical | Whether to enforce the plot to follow a symmetry (3 variables, the X axis has 0 as center, 4 variables, all axis have the same range and the plot is squared).
 plot_marginal_distributions
 logical | Whether to plot marginal distributions on the figure or not.
 marginal.type **character** | One of:

- density: Compute density plots on the margins.
- histogram: Compute histograms on the margins.
- boxplot: Compute boxplot on the margins.
- violin: Compute violin plots on the margins.
- densigram: Compute densigram plots on the margins.

 marginal.size **numeric** | Size ratio between the main and marginal plots. A value of 5 means that the main plot is 5 times bigger than the marginal plots.
 marginal.group **logical** | Whether to group the marginal distribution by group.by or current identities.
 plot_cell_borders
 logical | Whether to plot border around cells.
 plot_enrichment_scores
 logical | Whether to report enrichment scores for the input lists as plots.
 border.size **numeric** | Width of the border of the cells.
 border.color **character** | Color for the border of the heatmap body.
 pt.size **numeric** | Size of the dots.
 raster **logical** | Whether to raster the resulting plot. This is recommendable if plotting a lot of cells.
 raster.dpi **numeric** | Pixel resolution for rasterized plots. Defaults to 1024. Only activates on Seurat versions higher or equal than 4.1.0.
 plot_features **logical** | Whether to also report any other feature onto the primary plot.

```

features      character | Additional features to plot.
use_viridis   logical  | Whether to use viridis color scales.
viridis.palette
               character | A capital letter from A to H or the scale name as in scale_fill_viridis.
viridis.direction
               numeric  | Either 1 or -1. Controls how the gradient of viridis scale is formed.
sequential.palette
               character | Type of sequential color palette to use. Out of the sequential
                           palettes defined in brewer.pal.
sequential.direction
               numeric  | Direction of the sequential color scale. Either 1 or -1.
nbin          numeric  | Number of bins to use in AddModuleScore.
ctrl          numeric  | Number of genes in the control set to use in AddModuleScore.
number.breaks numeric  | Controls the number of breaks in continuous color scales of ggplot2-
                           based plots.
plot.title.face,    plot.subtitle.face,    plot.caption.face,
axis.title.face, axis.text.face, legend.title.face, legend.text.face
               character | Controls the style of the font for the corresponding theme element.
One of:
  • plain: For normal text.
  • italic: For text in italic.
  • bold: For text in bold.
  • bold.italic: For text both in italic and bold.

```

do_ChordDiagramPlot *Generate a Chord diagram.*

Description

Generate a Chord diagram.

Usage

```
do_ChordDiagramPlot(
  sample = NULL,
  from = NULL,
  to = NULL,
  colors.from = NULL,
  colors.to = NULL,
  colorblind = FALSE,
  big.gap = 10,
  small.gap = 1,
  link.border.color = NA,
  link.border.width = 1,
  highlight_group = NULL,
  alpha.highlight = 25,
  link.sort = NULL,
  link.decreasing = TRUE,
  z_index = FALSE,
  self.link = 1,
  symmetric = FALSE,
  directional = 1,
  direction.type = c("diffHeight", "arrows"),
  link.arr.type = "big.arrow",
  scale = FALSE,
  alignment = "default",
  annotationTrack = c("grid", "axis"),
  padding_labels = 4,
  font.size = 1
)
```

Arguments

sample	<code>Seurat</code> A Seurat object, generated by CreateSeuratObject .
from, to	<code>character</code> Categorical metadata variable to be used as origin and end points of the interactions.
colors.from, colors.to	<code>named_vector</code> Named vector of colors corresponding to the unique values of "from" and "to".
colorblind	<code>logical</code> Whether to use colorblind-friendly colors for categorical variables. In place when <code>colors.use</code> is not used. Allows for a maximum of 85 different classes within a categorical variable.
big.gap	<code>numeric</code> Space between the groups in "from" and "to".
small.gap	<code>numeric</code> Space within the groups.
link.border.color	<code>character</code> Color for the border of the links. NA = no color.
link.border.width	<code>numeric</code> Width of the border line of the links.

```

highlight_group
  character | A value from from that will be used to highlight only the links
  coming from it.

alpha.highlight
  numeric | A value between 00 (double digits) and 99 to depict the alpha of the
  highlighted links. No transparency needs "FF"

link.sort      pass to chordDiagramFromMatrix or chordDiagramFromDataFrame
link.decreasing
  pass to chordDiagramFromMatrix or chordDiagramFromDataFrame

z_index        logical | Whether to bring the bigger links to the top.

self.link      numeric | Behavior of the links. One of:
  • 1: Prevents self linking.
  • 2: Allows self linking.

symmetric     pass to chordDiagramFromMatrix

directional   numeric | Set the direction of the links. One of:
  • 0: Non-directional data.
  • 1: Links go from "from" to "to".
  • -1: Links go from "to" to "from".
  • 2: Links go in both directions.

direction.type character | How to display the directions. One of:
  • diffHeight: Sets a line at the origin of the group showing to how many
    groups and in which proportion this group is linked to.
  • arrows: Sets the connection as arrows.
  • both: Sets up both behaviors. Use as: c("diffHeight", "arrows").

link.arr.type character | Sets the appearance of the arrows. One of:
  • triangle: Arrow with a triangle tip at the end displayed on top of the link.
  • big.arrow: The link itself ends in a triangle shape.

scale          logical | Whether to put all nodes the same width.

alignment      character | How to align the diagram. One of:
  • default: Allows circize to set up the plot as it sees fit.
  • horizontal: Sets the break between "from" and "to" groups on the horizontal axis.
  • vertical: Sets the break between "from" and "to" groups on the vertical axis.

annotationTrack
  pass to chordDiagramFromMatrix or chordDiagramFromDataFrame

padding_labels numeric | Number of extra padding (white spaces) of the labels so that they do
  not overlap with the scales.

font.size      numeric | Overall font size of the plot. All plot elements will have a size relationship
  with this font size.

```

Value

A circlize plot.

Examples

```
# Check Suggests.
value <- SCpubr:::check_suggests(function_name = "do_ChordDiagramPlot", passive = TRUE)

if (isTRUE(value)){
  # Consult the full documentation in https://enblacar.github.io/SCpubr-book/
  # Define your Seurat object.
  sample <- readRDS(system.file("extdata/seurat_dataset_example.rds", package = "SCpubr"))

  # Basic chord diagram.
  sample$assignment <- ifelse(sample$seurat_clusters %in% c("0", "4", "7"), "A", "B")
  sample$assignment[sample$seurat_clusters %in% c("1", "2")] <- "C"
  sample$assignment[sample$seurat_clusters %in% c("10", "5")] <- "D"
  sample$assignment[sample$seurat_clusters %in% c("8", "9")] <- "E"

  p <- SCpubr::do_ChordDiagramPlot(sample = sample,
                                    from = "seurat_clusters",
                                    to = "assignment")

  p

} else if (base::isFALSE(value)){
  message("This function can not be used without its suggested packages.")
  message("Check out which ones are needed using `SCpubr::state_dependencies()`")
}
```

do_CNVHeatmap

Display CNV scores from inferCNV as Feature Plots.

Description

Display CNV scores from inferCNV as Feature Plots.

Usage

```
do_CNVHeatmap(
  sample,
  infercnv_object,
  chromosome_locations,
  group_by = NULL,
  using_metacells = FALSE,
  metacell_mapping = NULL,
```

```

include_chr_arms = FALSE,
values.show = FALSE,
values.threshold = NULL,
values.size = 3,
values.round = 1,
legend.type = "colorbar",
legend.position = "bottom",
legend.length = 20,
legend.width = 1,
legend.framewidth = 0.5,
legend.tickwidth = 0.5,
legend.framecolor = "grey50",
legend.tickcolor = "white",
font.size = 14,
pt.size = 1,
font.type = "sans",
axis.text.x.angle = 45,
enforce_symmetry = TRUE,
legend.title = NULL,
na.value = "grey75",
viridis.palette = "G",
viridis.direction = 1,
verbose = FALSE,
min.cutoff = NA,
max.cutoff = NA,
number.breaks = 5,
diverging.palette = "RdBu",
diverging.direction = -1,
sequential.palette = "YlGnBu",
sequential.direction = -1,
use_viridis = TRUE,
return_object = FALSE,
grid.color = "white",
border.color = "black",
flip = FALSE,
plot.title.face = "bold",
plot.subtitle.face = "plain",
plot.caption.face = "italic",
axis.title.face = "bold",
axis.text.face = "plain",
legend.title.face = "bold",
legend.text.face = "plain"
)

```

Arguments

sample	Seurat A Seurat object, generated by CreateSeuratObject .
inferencecnv_object	inferencecnv Output inferenceCNV object run on the same Seurat object.

```

chromosome_locations
  tibble | Tibble containing the chromosome regions to use. Can be obtained
  using utils::data("human_chr_locations", package = "SCpubr").
group.by      character | Metadata variable to group the output by. Has to be a character or
  factor column.
using_metacells
  logical | Whether inferCNV was run using metacells or not.
metacell_mapping
  named_vector | Vector or cell - metacell mapping.
include_chr_arms
  logical | Whether the output heatmap should also include chromosome arms
  or just whole chromosomes.
values.show    logical | Whether to add values as text in the heatmap.
values.threshold
  numeric | Value from which the text color turns from black to white. If mode =
  "hvg", this is applied to both ends of the color scale.
values.size     numeric | Size of the text labels.
values.round    numeric | Decimal to which round the values to.
legend.type     character | Type of legend to display. One of:
  • normal: Default legend displayed by ggplot2.
  • colorbar: Redefined colorbar legend, using guide_colorbar.
legend.position
  character | Position of the legend in the plot. One of:
  • top: Top of the figure.
  • bottom: Bottom of the figure.
  • left: Left of the figure.
  • right: Right of the figure.
  • none: No legend is displayed.
legend.length, legend.width
  numeric | Length and width of the legend. Will adjust automatically depending
  on legend side.
legend.framewidth, legend.tickwidth
  numeric | Width of the lines of the box in the legend.
legend.framecolor
  character | Color of the lines of the box in the legend.
legend.tickcolor
  character | Color of the ticks of the box in the legend.
font.size       numeric | Overall font size of the plot. All plot elements will have a size rela-
  tionship with this font size.
pt.size         numeric | Size of the dots.
font.type        character | Base font family for the plot. One of:
  • mono: Mono spaced font.
  • serif: Serif font family.

```

- sans: Default font family.

`axis.text.x.angle` `numeric` | Degree to rotate the X labels. One of: 0, 45, 90.

`enforce_symmetry` `logical` | Return a symmetrical plot axes-wise or continuous color scale-wise, when applicable.

`legend.title` `character` | Title for the legend.

`na.value` `character` | Color value for NA.

`viridis.palette` `character` | A capital letter from A to H or the scale name as in `scale_fill_viridis`.

`viridis.direction` `numeric` | Either 1 or -1. Controls how the gradient of viridis scale is formed.

`verbose` `logical` | Whether to show extra comments, warnings,etc.

`min.cutoff, max.cutoff` `numeric` | Set the min/max ends of the color scale. Any cell/group with a value lower than min.cutoff will turn into min.cutoff and any cell with a value higher than max.cutoff will turn into max.cutoff. In FeaturePlots, provide as many values as features. Use NAs to skip a feature.

`number.breaks` `numeric` | Controls the number of breaks in continuous color scales of ggplot2-based plots.

`diverging.palette` `character` | Type of symmetrical color palette to use. Out of the diverging palettes defined in `brewer.pal`.

`diverging.direction` `numeric` | Either 1 or -1. Direction of the diverging palette. This basically flips the two ends.

`sequential.palette` `character` | Type of sequential color palette to use. Out of the sequential palettes defined in `brewer.pal`.

`sequential.direction` `numeric` | Direction of the sequential color scale. Either 1 or -1.

`use_viridis` `logical` | Whether to use viridis color scales.

`return_object` `logical` | Returns the Seurat object with the modifications performed in the function. Normally, this contains a new assay with the data that can then be used for any other visualization desired.

`grid.color` `character` | Color of the grid in the plot. In heatmaps, color of the border of the cells.

`border.color` `character` | Color for the border of the heatmap body.

`flip` `logical` | Whether to invert the axis of the displayed plot.

`plot.title.face, plot.subtitle.face, plot.caption.face,`
`axis.title.face, axis.text.face, legend.title.face, legend.text.face`

`character` | Controls the style of the font for the corresponding theme element. One of:

- plain: For normal text.

- **italic**: For text in italic.
- **bold**: For text in bold.
- **bold.italic**: For text both in italic and bold.

Value

A list containing Feature Plots for different chromosome regions and corresponding dot plots by groups..

Examples

```
# Check Suggests.
value <- SCpubr:::check_suggests(function_name = "do_CNVHeatmap", passive = TRUE)

if (isTRUE(value)){
  # Consult the full documentation in https://enblacar.github.io/SCpubr-book/
  # This function expects that you have run inferCNV on your
  # own and you have access to the output object.

  # Define your Seurat object.
  sample <- readRDS(system.file("extdata/seurat_dataset_example.rds",
                                 package = "SCpubr"))

  # Define your inferCNV object.
  infercnv_object <- readRDS(system.file("extdata/infercnv_object_example.rds",
                                         package = "SCpubr"))

  # Get human chromosome locations.
  chromosome_locations = SCpubr::human_chr_locations

  # Compute for all chromosomes.
  p <- SCpubr::do_CNVHeatmap(sample = sample,
                               infercnv_object = infercnv_object,
                               using_metacells = FALSE,
                               chromosome_locations = chromosome_locations)

} else if (base::isFALSE(value)){
  message("This function can not be used without its suggested packages.")
  message("Check out which ones are needed using `SCpubr::state_dependencies()`")
}
```

`do_ColorBlindCheck`

Generate colorblind variations of a given color palette.

Description

This function generate colorblind variations of a provided color palette in order to check if it is colorblind friendly. Variations are generated using colorspace package.

Usage

```
do_ColorBlindCheck(
  colors.use,
  flip = FALSE,
  font.size = 14,
  font.type = "sans",
  plot.title.face = "bold",
  plot.subtitle.face = "plain",
  plot.caption.face = "italic",
  axis.title.face = "bold",
  axis.text.face = "plain",
  legend.text.face = "plain",
  legend.title.face = "bold",
  grid.color = "white",
  border.color = "black",
  axis.text.x.angle = 45
)
```

Arguments

colors.use	character One color upon which generate the color scale. Can be a name or a HEX code.
flip	logical Whether to invert the axis of the displayed plot.
font.size	numeric Overall font size of the plot. All plot elements will have a size relationship with this font size.
font.type	character Base font family for the plot. One of: <ul style="list-style-type: none"> • mono: Mono spaced font. • serif: Serif font family. • sans: Default font family.
plot.title.face, axis.title.face, axis.text.face, legend.title.face, legend.text.face	character Controls the style of the font for the corresponding theme element. One of: <ul style="list-style-type: none"> • plain: For normal text. • italic: For text in italic. • bold: For text in bold. • bold.italic: For text both in italic and bold.
grid.color	character Color of the grid in the plot. In heatmaps, color of the border of the cells.
border.color	character Color for the border of the heatmap body.
axis.text.x.angle	numeric Degree to rotate the X labels. One of: 0, 45, 90.

Value

A character vector with the desired color scale.

Examples

```
# Check Suggests.
value <- SCpubr:::check_suggests(function_name = "do_ColorBlindCheck", passive = TRUE)

if (isTRUE(value)){
  # Generate a color wheel based on a single value.
  colors <- c("red", "green", "blue")
  p <- SCpubr:::do_ColorBlindCheck(colors.use = colors)

} else if (base::isFALSE(value)){
  message("This function can not be used without its suggested packages.")
  message("Check out which ones are needed using `SCpubr::state_dependencies()`")
}
```

do_ColorPalette *Generate color scales based on a value.*

Description

This function is an adaptation of colortools package. As the package was removed from CRAN on 23-06-2022, this utility function came to existence in order to cover the gap. It is, on its basis, an adaptation of the package into a single function. Original code, developed by Gaston Sanchez, can be found in: <https://github.com/gastonstat/colortools>

Usage

```
do_ColorPalette(
  colors.use,
  n = 12,
  opposite = FALSE,
  adjacent = FALSE,
  triadic = FALSE,
  split_complementary = FALSE,
  tetradic = FALSE,
  square = FALSE,
  complete_output = FALSE,
  plot = FALSE,
  font.size = 14,
  font.type = "sans"
)
```

Arguments

<code>colors.use</code>	<code>character</code> One color upon which generate the color scale. Can be a name or a HEX code.
<code>n</code>	<code>numeric</code> Number of colors to include in the color wheel. Use it when all other options are FALSE, otherwise, it becomes 12.

opposite `logical` | Return the opposing color to the one provided.
 adjacent `logical` | Return the adjacent colors to the one provided.
 triadic `logical` | Return the triadic combination of colors to the one provided.
 split_complementary
 `logical` | Return the split complementary combination of colors to the one provided.
 tetradic `logical` | Return the tetradic combination of colors to the one provided.
 square `logical` | Return the square combination of colors to the one provided.
 complete_output
 `logical` | Runs all the previous options and returns all the outputs as a list that contains all color vectors, all plots and a combined plot with everything.
 plot `logical` | Whether to also return a plot displaying the values instead of a vector with the color.
 font.size `numeric` | Overall font size of the plot. All plot elements will have a size relationship with this font size.
 font.type `character` | Base font family for the plot. One of:
 • mono: Mono spaced font.
 • serif: Serif font family.
 • sans: Default font family.

Value

A character vector with the desired color scale.

Examples

```

# Check Suggests.
value <- SCpubr:::check_suggests(function_name = "do_ColorPalette", passive = TRUE)

if (isTRUE(value)){
  # Generate a color wheel based on a single value.
  colors <- SCpubr:::do_ColorPalette(colors.use = "steelblue")
  p <- SCpubr:::do_ColorPalette(colors.use = "steelblue",
                                plot = TRUE)

  # Generate a pair of opposite colors based on a given one.
  colors <- SCpubr:::do_ColorPalette(colors.use = "steelblue",
                                      opposite = TRUE)
  p <- SCpubr:::do_ColorPalette(colors.use = "steelblue",
                                opposite = TRUE,
                                plot = TRUE)

  # Generate a trio of adjacent colors based on a given one.
  colors <- SCpubr:::do_ColorPalette(colors.use = "steelblue",
                                      adjacent = TRUE)
  p <- SCpubr:::do_ColorPalette(colors.use = "steelblue",
                                adjacent = TRUE,
                                plot = TRUE)
}

```

```

# Generate a trio of triadic colors based on a given one.

  plot.title.face = "bold",  
  plot.subtitle.face = "plain",  
  plot.caption.face = "italic",  
  axis.title.face = "bold",  
  axis.text.face = "plain",  
  legend.title.face = "bold",
```

```
    legend.text.face = "plain"
)
```

Arguments

sample	<code>Seurat</code> A Seurat object, generated by CreateSeuratObject .
input_gene_list	<code>named_list</code> Named list of lists of genes to be used as input.
cluster	<code>logical</code> Whether to cluster the elements in the heatmap or not.
remove.diagonal	<code>logical</code> Whether to convert diagonal to NA. Normally this value would be 1, heavily shifting the color scale.
mode	<code>character</code> Different types of correlation matrices can be computed. Right now, the only possible value is "hvg", standing for Highly Variable Genes. The sample is subset for the HVG and the data is re-scaled. Scale data is used for the correlation.
values.show	<code>logical</code> Whether to add values as text in the heatmap.
values.threshold	<code>numeric</code> Value from which the text color turns from black to white. If mode = "hvg", this is applied to both ends of the color scale.
values.size	<code>numeric</code> Size of the text labels.
values.round	<code>numeric</code> Decimal to which round the values to.
assay	<code>character</code> Assay to use. Defaults to the current assay.
group.by	<code>character</code> Metadata variable to group the output by. Has to be a character of factor column.
legend.title	<code>character</code> Title for the legend.
enforce_symmetry	<code>logical</code> Return a symmetrical plot axes-wise or continuous color scale-wise, when applicable.
font.size	<code>numeric</code> Overall font size of the plot. All plot elements will have a size relationship with this font size.
font.type	<code>character</code> Base font family for the plot. One of: <ul style="list-style-type: none"> • mono: Mono spaced font. • serif: Serif font family. • sans: Default font family.
na.value	<code>character</code> Color value for NA.
legend.length, legend.width	<code>numeric</code> Length and width of the legend. Will adjust automatically depending on legend side.
legend.framewidth, legend.tickwidth	<code>numeric</code> Width of the lines of the box in the legend.
legend.framecolor	<code>character</code> Color of the lines of the box in the legend.

`legend.tickcolor`
`character` | Color of the ticks of the box in the legend.

`legend.type` `character` | Type of legend to display. One of:

- `normal`: Default legend displayed by `ggplot2`.
- `colorbar`: Redefined colorbar legend, using `guide_colorbar`.

`legend.position`
`character` | Position of the legend in the plot. One of:

- `top`: Top of the figure.
- `bottom`: Bottom of the figure.
- `left`: Left of the figure.
- `right`: Right of the figure.
- `none`: No legend is displayed.

`min.cutoff, max.cutoff`
`numeric` | Set the min/max ends of the color scale. Any cell/group with a value lower than `min.cutoff` will turn into `min.cutoff` and any cell with a value higher than `max.cutoff` will turn into `max.cutoff`. In FeaturePlots, provide as many values as features. Use NAs to skip a feature.

`number.breaks` `numeric` | Controls the number of breaks in continuous color scales of ggplot2-based plots.

`plot.title, plot.subtitle, plot.caption`
`character` | Title, subtitle or caption to use in the plot.

`diverging.palette`
`character` | Type of symmetrical color palette to use. Out of the diverging palettes defined in `brewer.pal`.

`diverging.direction`
`numeric` | Either 1 or -1. Direction of the diverging palette. This basically flips the two ends.

`use_viridis` `logical` | Whether to use viridis color scales.

`viridis.palette`
`character` | A capital letter from A to H or the scale name as in `scale_fill_viridis`.

`viridis.direction`
`numeric` | Either 1 or -1. Controls how the gradient of viridis scale is formed.

`sequential.palette`
`character` | Type of sequential color palette to use. Out of the sequential palettes defined in `brewer.pal`.

`sequential.direction`
`numeric` | Direction of the sequential color scale. Either 1 or -1.

`axis.text.x.angle`
`numeric` | Degree to rotate the X labels. One of: 0, 45, 90.

`grid.color` `character` | Color of the grid in the plot. In heatmaps, color of the border of the cells.

`border.color` `character` | Color for the border of the heatmap body.

```
plot.title.face,      plot.subtitle.face,      plot.caption.face,
axis.title.face, axis.text.face, legend.title.face, legend.text.face
  character | Controls the style of the font for the corresponding theme element.
  One of:
    • plain: For normal text.
    • italic: For text in italic.
    • bold: For text in bold.
    • bold.italic: For text both in italic and bold.
```

Value

A ggplot2 object.

Examples

```
# Check Suggests.
value <- SCpubr:::check_suggests(function_name = "do_CorrelationHeatmap", passive = TRUE)

if (isTRUE(value)){
  # Consult the full documentation in https://enblacar.github.io/SCpubr-book/
  # Define your Seurat object.
  sample <- readRDS(system.file("extdata/seurat_dataset_example.rds", package = "SCpubr"))

  # Default values.
  p <- SCpubr::do_CorrelationHeatmap(sample = sample)
  p

} else if (base:::isFALSE(value)){
  message("This function can not be used without its suggested packages.")
  message("Check out which ones are needed using `SCpubr::state_dependencies()`")
}
```

do_DimPlot

Wrapper for DimPlot.

Description

Wrapper for [DimPlot](#).

Usage

```
do_DimPlot(
  sample,
  reduction = NULL,
  group.by = NULL,
```

```
split.by = NULL,
split.by.combined = TRUE,
colors.use = NULL,

axis.text.face = "plain",
legend.title.face = "bold",
legend.text.face = "plain"
)

```

Arguments

sample	Seurat A Seurat object, generated by CreateSeuratObject .
reduction	character Reduction to use. Can be the canonical ones such as "umap", "pca", or any custom ones, such as "diffusion". If you are unsure about which reductions you have, use <code>Seurat::Reductions(sample)</code> . Defaults to "umap" if present or to the last computed reduction if the argument is not provided.
group.by	character Metadata variable to group the output by. Has to be a character or factor column.
split.by	character Secondary metadata variable to further group (split) the output by. Has to be a character of factor column.
split.by.combined	logical Adds a combined view of all the values before splitting them by <code>split.by</code> . Think of this as a regular DimPlot added in front. This is set to TRUE if <code>split.by</code> is used in combination with <code>group.by</code> .
colors.use	named_vector Named vector of valid color representations (either name of HEX codes) with as many named colors as unique values of <code>group.by</code> . If <code>group.by</code> is not provided, defaults to the unique values of Idents . If not provided, a color scale will be set by default.
colorblind	logical Whether to use colorblind-friendly colors for categorical variables. In place when <code>colors.use</code> is not used. Allows for a maximum of 85 different classes within a categorical variable.
shuffle	logical Whether to shuffle the cells or not, so that they are not plotted cluster-wise. Recommended.
order	character Vector of identities to be plotted. Either one with all identities or just some, which will be plotted last.
raster	logical Whether to raster the resulting plot. This is recommendable if plotting a lot of cells.
pt.size	numeric Size of the dots.
label	logical Whether to plot the cluster labels in the UMAP. The cluster labels will have the same color as the cluster colors.
label.color	character Color of the labels in the plot.
label.fill	character Color to fill the labels. Has to be a single color, that will be used for all labels. If NULL, the colors of the clusters will be used instead.

label.size **numeric** | Size of the labels in the plot.
 label.box **logical** | Whether to plot the plot labels as `geom_text` (FALSE) or `geom_label` (TRUE).
 repel **logical** | Whether to repel the text labels.
 cells.highlight, idents.highlight
 character | Vector of cells/identities to focus into. The identities have to much those in `Seurat::Idents(sample)` The rest of the cells will be grayed out. Both parameters can be used at the same time.
 idents.keep **character** | Vector of identities to keep. This will effectively set the rest of the cells that do not match the identities provided to NA, therefore coloring them according to na.value parameter.
 sizes.highlight
 numeric | Point size of highlighted cells using cells.highlight parameter.
 ncol **numeric** | Number of columns used in the arrangement of the output plot using "split.by" parameter.
 plot.title, plot.subtitle, plot.caption
 character | Title, subtitle or caption to use in the plot.
 legend.title **character** | Title for the legend.
 legend.position
 character | Position of the legend in the plot. One of:
 • top: Top of the figure.
 • bottom: Bottom of the figure.
 • left: Left of the figure.
 • right: Right of the figure.
 • none: No legend is displayed.
 legend.title.position
 character | Position for the title of the legend. One of:
 • top: Top of the legend.
 • bottom: Bottom of the legend.
 • left: Left of the legend.
 • right: Right of the legend.
 legend.ncol **numeric** | Number of columns in the legend.
 legend.nrow **numeric** | Number of rows in the legend.
 legend.icon.size
 numeric | Size of the icons in legend.
 legend.byrow **logical** | Whether the legend is filled by row or not.
 legend.dot.border
 logical | Adds a black border around the dots in the legend.
 raster.dpi **numeric** | Pixel resolution for rasterized plots. Defaults to 1024. Only activates on Seurat versions higher or equal than 4.1.0.
 dims **numeric** | Vector of 2 numerics indicating the dimensions to plot out of the selected reduction. Defaults to c(1, 2) if not specified.

`font.size` `numeric` | Overall font size of the plot. All plot elements will have a size relationship with this font size.

`font.type` `character` | Base font family for the plot. One of:

- `mono`: Mono spaced font.
- `serif`: Serif font family.
- `sans`: Default font family.

`na.value` `character` | Color value for NA.

`plot_cell_borders` `logical` | Whether to plot border around cells.

`border.size` `numeric` | Width of the border of the cells.

`border.color` `character` | Color for the border of the heatmap body.

`border.density` `numeric` | Controls the number of cells used when `plot_cell_borders` = TRUE. Value between 0 and 1. It computes a 2D kernel density and based on this cells that have a density below the specified quantile will be used to generate the cluster contour. The lower this number, the less cells will be selected, thus reducing the overall size of the plot but also potentially preventing all the contours to be properly drawn.

`plot_marginal_distributions` `logical` | Whether to plot marginal distributions on the figure or not.

`marginal.type` `character` | One of:

- `density`: Compute density plots on the margins.
- `histogram`: Compute histograms on the margins.
- `boxplot`: Compute boxplot on the margins.
- `violin`: Compute violin plots on the margins.
- `densigram`: Compute densigram plots on the margins.

`marginal.size` `numeric` | Size ratio between the main and marginal plots. A value of 5 means that the main plot is 5 times bigger than the marginal plots.

`marginal.group` `logical` | Whether to group the marginal distribution by `group.by` or current identities.

`plot.axes` `logical` | Whether to plot axes or not.

`plot_density_contour` `logical` | Whether to plot density contours in the UMAP.

`contour.position` `character` | Whether to plot density contours on top or at the bottom of the visualization layers, thus overlapping the clusters/cells or not.

`contour.color` `character` | Color of the density lines.

`contour.lineend` `character` | Line end style (round, butt, square).

`contour.linejoin` `character` | Line join style (round, mitre, bevel).

`contour_expand_axes` `numeric` | To make the contours fit the plot, the limits of the X and Y axis are expanding a given percentage from the min and max values for each axis. This controls such percentage.

```
plot.title.face,      plot.subtitle.face,      plot.caption.face,
axis.title.face, axis.text.face, legend.title.face, legend.text.face
  character | Controls the style of the font for the corresponding theme element.
  One of:
    • plain: For normal text.
    • italic: For text in italic.
    • bold: For text in bold.
    • bold.italic: For text both in italic and bold.
```

Value

A ggplot2 object containing a DimPlot.

Examples

```
# Check Suggests.
value <- SCpubr:::check_suggests(function_name = "do_DimPlot", passive = TRUE)

if (isTRUE(value)){
  # Consult the full documentation in https://enblacar.github.io/SCpubr-book/

  # Define your Seurat object.
  sample <- readRDS(system.file("extdata/seurat_dataset_example.rds", package = "SCpubr"))

  # Basic DimPlot.
  p <- SCpubr:::do_DimPlot(sample = sample)

  # Restrict the amount of identities displayed.
  p <- SCpubr:::do_DimPlot(sample = sample,
                           idents.keep = c("1", "3", "5"))

  # Group by another variable rather than `Seurat::Idents(sample)`
  p <- SCpubr:::do_DimPlot(sample = sample,
                           group.by = "seurat_clusters")

  # Split the output in as many plots as unique identities.
  p <- SCpubr:::do_DimPlot(sample = sample,
                           split.by = "seurat_clusters")

  # Highlight given identities
  p <- SCpubr:::do_DimPlot(sample,
                           idents.highlight = c("1", "3"))

} else if (base:::isFALSE(value)){
  message("This function can not be used without its suggested packages.")
  message("Check out which ones are needed using `SCpubr::state_dependencies()`.")
}
```

)

```

Arguments

sample	Seurat A Seurat object, generated by CreateSeuratObject .
features	character Features to represent.
assay	character Assay to use. Defaults to the current assay.
slot	character Data slot to use. Only one of: counts, data, scale.data. Defaults to "data".
group.by	character Metadata variable to group the output by. Has to be a character or factor column.
split.by	character Secondary metadata variable to further group (split) the output by. Has to be a character of factor column.
zscore.data	logical Whether to compute Z-scores instead of showing average expression values. This allows to see, for each gene, which group has the highest average expression, but prevents you from comparing values across genes. Can not be used with slot = "scale.data" or with split.by.
min.cutoff, max.cutoff	numeric Set the min/max ends of the color scale. Any cell/group with a value lower than min.cutoff will turn into min.cutoff and any cell with a value higher than max.cutoff will turn into max.cutoff. In FeaturePlots, provide as many values as features. Use NAs to skip a feature.
dot.min	numeric Ranges from 0 to 100. Filter out dots whose Percent Expressed falls below this threshold.
enforce_symmetry	logical Return a symmetrical plot axes-wise or continuous color scale-wise, when applicable.
legend.title	character Title for the legend.

legend.type	<code>character</code> Type of legend to display. One of:
	<ul style="list-style-type: none"> • <code>normal</code>: Default legend displayed by <code>ggplot2</code>. • <code>colorbar</code>: Redefined colorbar legend, using <code>guide_colorbar</code>.
legend.position	<code>character</code> Position of the legend in the plot. One of:
	<ul style="list-style-type: none"> • <code>top</code>: Top of the figure. • <code>bottom</code>: Bottom of the figure. • <code>left</code>: Left of the figure. • <code>right</code>: Right of the figure. • <code>none</code>: No legend is displayed.
legend.framewidth, legend.tickwidth	<code>numeric</code> Width of the lines of the box in the legend.
legend.length, legend.width	<code>numeric</code> Length and width of the legend. Will adjust automatically depending on legend side.
legend.framecolor	<code>character</code> Color of the lines of the box in the legend.
legend.tickcolor	<code>character</code> Color of the ticks of the box in the legend.
legend.ncol	<code>numeric</code> Number of columns in the legend.
legend.nrow	<code>numeric</code> Number of rows in the legend.
legend.byrow	<code>logical</code> Whether the legend is filled by row or not.
dot.scale	<code>numeric</code> Scale the size of the dots.
plot.title, plot.subtitle, plot.caption	<code>character</code> Title, subtitle or caption to use in the plot.
xlab, ylab	<code>character</code> Titles for the X and Y axis.
font.size	<code>numeric</code> Overall font size of the plot. All plot elements will have a size relationship with this font size.
font.type	<code>character</code> Base font family for the plot. One of:
	<ul style="list-style-type: none"> • <code>mono</code>: Mono spaced font. • <code>serif</code>: Serif font family. • <code>sans</code>: Default font family.
cluster	<code>logical</code> Whether to cluster the identities based on the expression of the features.
flip	<code>logical</code> Whether to invert the axis of the displayed plot.
axis.text.x.angle	<code>numeric</code> Degree to rotate the X labels. One of: 0, 45, 90.
use_viridis	<code>logical</code> Whether to use viridis color scales.
viridis.palette	<code>character</code> A capital letter from A to H or the scale name as in <code>scale_fill_viridis</code> .
viridis.direction	<code>numeric</code> Either 1 or -1. Controls how the gradient of viridis scale is formed.

```

sequential.palette
  character | Type of sequential color palette to use. Out of the sequential
  palettes defined in brewer.pal.
sequential.direction
  numeric | Direction of the sequential color scale. Either 1 or -1.
diverging.palette
  character | Type of symmetrical color palette to use. Out of the diverging
  palettes defined in brewer.pal.
diverging.direction
  numeric | Either 1 or -1. Direction of the diverging palette. This basically flips
  the two ends.
na.value      character | Color value for NA.
plot.grid     logical | Whether to plot grid lines.
grid.color    character | Color of the grid in the plot. In heatmaps, color of the border of the
cells.
grid.type     character | One of the possible linetype options:
  • blank.
  • solid.
  • dashed.
  • dotted.
  • dotdash.
  • longdash.
  • twodash.
number.breaks numeric | Controls the number of breaks in continuous color scales of ggplot2-
based plots.
plot.title.face,       plot.subtitle.face,       plot.caption.face,
axis.title.face, axis.text.face, legend.title.face, legend.text.face
  character | Controls the style of the font for the corresponding theme element.
One of:
  • plain: For normal text.
  • italic: For text in italic.
  • bold: For text in bold.
  • bold.italic: For text both in italic and bold.

```

Value

A ggplot2 object containing a Dot Plot.

Examples

```

# Check Suggests.
value <- SCpubr:::check_suggests(function_name = "do_DotPlot", passive = TRUE)

if (isTRUE(value)){
  # Consult the full documentation in https://enblacar.github.io/SCpubr-book/
}

```

```

# Define your Seurat object.
# sample <- readRDS(system.file("extdata/seurat_dataset_example.rds", package = "SCpubr"))

# Basic Dot plot.
# genes <- rownames(sample)[1:14]
# p <- SCpubr::do_DotPlot(sample = sample,
#                           features = genes)

} else if (base::isFALSE(value)){
  message("This function can not be used without its suggested packages.")
  message("Check out which ones are needed using `SCpubr::state_dependencies()`")
}
```

do_EnrichmentHeatmap *Create enrichment scores heatmaps.*

Description

This function computes the enrichment scores for the cells using [AddModuleScore](#) and then aggregates the scores by the metadata variables provided by the user and displays it as a heatmap, computed by [Heatmap](#).

Usage

```
do_EnrichmentHeatmap(
  sample,
  input_gene_list,
  features.order = NULL,
  groups.order = NULL,
  cluster = TRUE,
  scale_scores = FALSE,
  assay = NULL,
  slot = NULL,
  reduction = NULL,
  group.by = NULL,
  values.show = FALSE,
  values.threshold = NULL,
  values.size = 3,
  values.round = 1,
  verbose = FALSE,
  na.value = "grey75",
  legend.position = "bottom",
  use_viridis = FALSE,
  viridis.palette = "G",
  viridis.direction = 1,
  legend.framewidth = 0.5,
```

```

legend.tickwidth = 0.5,
legend.length = 20,
legend.width = 1,
legend.framecolor = "grey50",
legend.tickcolor = "white",
legend.type = "colorbar",
font.size = 14,
font.type = "sans",
axis.text.x.angle = 45,
enforce_symmetry = FALSE,
nbin = 24,
ctrl = 100,
flavor = "Seurat",
legend.title = NULL,
ncores = 1,
storeRanks = TRUE,
min.cutoff = NA,
max.cutoff = NA,
pt.size = 1,
plot_cell_borders = TRUE,
border.size = 2,
return_object = FALSE,
number.breaks = 5,
sequential.palette = "YlGnBu",
diverging.palette = "RdBu",
diverging.direction = -1,
sequential.direction = 1,
flip = FALSE,
grid.color = "white",
border.color = "black",
plot.title.face = "bold",
plot.subtitle.face = "plain",
plot.caption.face = "italic",
axis.title.face = "bold",
axis.text.face = "plain",
legend.title.face = "bold",
legend.text.face = "plain"
)

```

Arguments

- sample** `Seurat` | A Seurat object, generated by [CreateSeuratObject](#).
- input_gene_list** `named_list` | Named list of lists of genes to be used as input.
- features.order** `character` | Should the gene sets be ordered in a specific way? Provide it as a vector of characters with the same names as the names of the gene sets.
- groups.order** `named_list` | Should the groups in theheatmaps be ordered in a specific way? Provide it as a named list (as many lists as values in group.by) with the order

	for each of the elements in the groups.
cluster	<code>logical</code> Whether to perform clustering of rows and columns.
scale_scores	<code>logical</code> Whether to transform the scores to a range of 0-1 for plotting.
assay	<code>character</code> Assay to use. Defaults to the current assay.
slot	<code>character</code> Data slot to use. Only one of: counts, data, scale.data. Defaults to "data".
reduction	<code>character</code> Reduction to use. Can be the canonical ones such as "umap", "pca", or any custom ones, such as "diffusion". If you are unsure about which reductions you have, use <code>Seurat::Reductions(sample)</code> . Defaults to "umap" if present or to the last computed reduction if the argument is not provided.
group.by	<code>character</code> Metadata variable to group the output by. Has to be a character of factor column.
values.show	<code>logical</code> Whether to add values as text in the heatmap.
values.threshold	<code>numeric</code> Value from which the text color turns from black to white. If mode = "hvg", this is applied to both ends of the color scale.
values.size	<code>numeric</code> Size of the text labels.
values.round	<code>numeric</code> Decimal to which round the values to.
verbose	<code>logical</code> Whether to show extra comments, warnings,etc.
na.value	<code>character</code> Color value for NA.
legend.position	<code>character</code> Position of the legend in the plot. One of: <ul style="list-style-type: none">• top: Top of the figure.• bottom: Bottom of the figure.• left: Left of the figure.• right: Right of the figure.• none: No legend is displayed.
use_viridis	<code>logical</code> Whether to use viridis color scales.
viridis.palette	<code>character</code> A capital letter from A to H or the scale name as in <code>scale_fill_viridis</code> .
viridis.direction	<code>numeric</code> Either 1 or -1. Controls how the gradient of viridis scale is formed.
legend.framewidth, legend.tickwidth	<code>numeric</code> Width of the lines of the box in the legend.
legend.length, legend.width	<code>numeric</code> Length and width of the legend. Will adjust automatically depending on legend side.
legend.framecolor	<code>character</code> Color of the lines of the box in the legend.
legend.tickcolor	<code>character</code> Color of the ticks of the box in the legend.
legend.type	<code>character</code> Type of legend to display. One of:

	<ul style="list-style-type: none"> • normal: Default legend displayed by ggplot2. • colorbar: Redefined colorbar legend, using guide_colorbar.
font.size	numeric Overall font size of the plot. All plot elements will have a size relationship with this font size.
font.type	character Base font family for the plot. One of: <ul style="list-style-type: none"> • mono: Mono spaced font. • serif: Serif font family. • sans: Default font family.
axis.text.x.angle	numeric Degree to rotate the X labels. One of: 0, 45, 90.
enforce_symmetry	logical Whether the geyser and feature plot has a symmetrical color scale.
nbin	numeric Number of bins to use in AddModuleScore .
ctrl	numeric Number of genes in the control set to use in AddModuleScore .
flavor	character One of: Seurat, UCell. Compute the enrichment scores using AddModuleScore or AddModuleScore_UCell .
legend.title	character Title for the legend.
ncores	numeric Number of cores used to run UCell scoring.
storeRanks	logical Whether to store the ranks for faster UCell scoring computations. Might require large amounts of RAM.
min.cutoff, max.cutoff	numeric Set the min/max ends of the color scale. Any cell/group with a value lower than min.cutoff will turn into min.cutoff and any cell with a value higher than max.cutoff will turn into max.cutoff. In FeaturePlots, provide as many values as features. Use NAs to skip a feature.
pt.size	numeric Size of the dots.
plot_cell_borders	logical Whether to plot border around cells.
border.size	numeric Width of the border of the cells.
return_object	logical Return the Seurat object with the enrichment scores stored.
number.breaks	numeric Controls the number of breaks in continuous color scales of ggplot2-based plots.
sequential.palette	character Type of sequential color palette to use. Out of the sequential palettes defined in brewer.pal .
diverging.palette	character Type of symmetrical color palette to use. Out of the diverging palettes defined in brewer.pal .
diverging.direction	numeric Either 1 or -1. Direction of the diverging palette. This basically flips the two ends.
sequential.direction	numeric Direction of the sequential color scale. Either 1 or -1.

flip `logical` | Whether to invert the axis of the displayed plot.

grid.color `character` | Color of the grid in the plot. In heatmaps, color of the border of the cells.

border.color `character` | Color for the border of the heatmap body.

plot.title.face, **plot.subtitle.face**, **plot.caption.face**,
axis.title.face, **axis.text.face**, **legend.title.face**, **legend.text.face**
`character` | Controls the style of the font for the corresponding theme element.
One of:

- **plain**: For normal text.
- **italic**: For text in italic.
- **bold**: For text in bold.
- **bold.italic**: For text both in italic and bold.

Value

A ggplot2 object.

Examples

```
# Check Suggests.
value <- SCpubr:::check_suggests(function_name = "do_EnrichmentHeatmap", passive = TRUE)

if (isTRUE(value)){
  # Consult the full documentation in https://enblacar.github.io/SCpubr-book/
  # Define your Seurat object.
  sample <- readRDS(system.file("extdata/seurat_dataset_example.rds", package = "SCpubr"))

  # Genes have to be unique.
  genes <- list("A" = rownames(sample)[1:5],
                "B" = rownames(sample)[6:10],

  message("Check out which ones are needed using `SCpubr::state_dependencies()`")
}
```

do_ExpressionHeatmap *Create heatmaps of averaged expression by groups.*

Description

This function generates a heatmap with averaged expression values by the unique groups of the metadata variables provided by the user.

Usage

```
do_ExpressionHeatmap(
  sample,
  features,
  group.by = NULL,
  assay = NULL,
  cluster = TRUE,
  features.order = NULL,
  groups.order = NULL,
  slot = "data",
  values.show = FALSE,
  values.threshold = NULL,
  values.size = 3,
  values.round = 1,
  legend.title = "Avg. Expression",
  na.value = "grey75",
  legend.position = "bottom",
  legend.width = 1,
  legend.length = 20,
  legend.framewidth = 0.5,
  legend.tickwidth = 0.5,
  legend.framecolor = "grey50",
  legend.tickcolor = "white",
  legend.type = "colorbar",
  font.size = 14,
  font.type = "sans",
  axis.text.x.angle = 45,
  enforce_symmetry = FALSE,
  min.cutoff = NA,
  max.cutoff = NA,
  diverging.palette = "RdBu",
  diverging.direction = -1,
  sequential.palette = "YlGnBu",
  sequential.direction = 1,
  number.breaks = 5,
  use_viridis = FALSE,
  viridis.palette = "G",
  viridis.direction = -1,
```

```

    flip = FALSE,
    grid.color = "white",
    border.color = "black",
    plot.title.face = "bold",
    plot.subtitle.face = "plain",
    plot.caption.face = "italic",
    axis.title.face = "bold",
    axis.text.face = "plain",
    legend.title.face = "bold",
    legend.text.face = "plain"
)

```

Arguments

sample	<code>Seurat</code> A Seurat object, generated by CreateSeuratObject .
features	<code>character</code> Features to represent.
group.by	<code>character</code> Metadata variable to group the output by. Has to be a character or factor column.
assay	<code>character</code> Assay to use. Defaults to the current assay.
cluster	<code>logical</code> Whether to perform clustering of rows and columns.
features.order	<code>character</code> Should the gene sets be ordered in a specific way? Provide it as a vector of characters with the same names as the names of the gene sets.
groups.order	<code>named_list</code> Should the groups in theheatmaps be ordered in a specific way? Provide it as a named list (as many lists as values in <code>group.by</code>) with the order for each of the elements in the groups.
slot	<code>character</code> Data slot to use. Only one of: counts, data, scale.data. Defaults to "data".
values.show	<code>logical</code> Whether to add values as text in the heatmap.
values.threshold	<code>numeric</code> Value from which the text color turns from black to white. If mode = "hvg", this is applied to both ends of the color scale.
values.size	<code>numeric</code> Size of the text labels.
values.round	<code>numeric</code> Decimal to which round the values to.
legend.title	<code>character</code> Title for the legend.
na.value	<code>character</code> Color value for NA.
legend.position	<code>character</code> Position of the legend in the plot. One of: <ul style="list-style-type: none"> • top: Top of the figure. • bottom: Bottom of the figure. • left: Left of the figure. • right: Right of the figure. • none: No legend is displayed.
legend.length, legend.width	<code>numeric</code> Length and width of the legend. Will adjust automatically depending on legend side.

```

legend.framewidth, legend.tickwidth
    numeric | Width of the lines of the box in the legend.
legend.framecolor
    character | Color of the lines of the box in the legend.
legend.tickcolor
    character | Color of the ticks of the box in the legend.
legend.type      character | Type of legend to display. One of:
                    • normal: Default legend displayed by ggplot2.
                    • colorbar: Redefined colorbar legend, using guide_colorbar.
font.size        numeric | Overall font size of the plot. All plot elements will have a size relationship with this font size.
font.type        character | Base font family for the plot. One of:
                    • mono: Mono spaced font.
                    • serif: Serif font family.
                    • sans: Default font family.
axis.text.x.angle
    numeric | Degree to rotate the X labels. One of: 0, 45, 90.
enforce_symmetry
    logical | Return a symmetrical plot axes-wise or continuous color scale-wise,
when applicable.
min.cutoff, max.cutoff
    numeric | Set the min/max ends of the color scale. Any cell/group with a value lower than min.cutoff will turn into min.cutoff and any cell with a value higher than max.cutoff will turn into max.cutoff. In FeaturePlots, provide as many values as features. Use NAs to skip a feature.
diverging.palette
    character | Type of symmetrical color palette to use. Out of the diverging palettes defined in brewer.pal.
diverging.direction
    numeric | Either 1 or -1. Direction of the diverging palette. This basically flips the two ends.
sequential.palette
    character | Type of sequential color palette to use. Out of the sequential palettes defined in brewer.pal.
sequential.direction
    numeric | Direction of the sequential color scale. Either 1 or -1.
number.breaks   numeric | Controls the number of breaks in continuous color scales of ggplot2-based plots.
use_viridis     logical | Whether to use viridis color scales.
viridis.palette
    character | A capital letter from A to H or the scale name as in scale_fill_viridis.
viridis.direction
    numeric | Either 1 or -1. Controls how the gradient of viridis scale is formed.
flip            logical | Whether to invert the axis of the displayed plot.

```

grid.color **character** | Color of the grid in the plot. In heatmaps, color of the border of the cells.
 border.color **character** | Color for the border of the heatmap body.
 plot.title.face, plot.subtitle.face, plot.caption.face,
 axis.title.face, axis.text.face, legend.title.face, legend.text.face
character | Controls the style of the font for the corresponding theme element.
 One of:

- plain: For normal text.
- italic: For text in italic.
- bold: For text in bold.
- bold.italic: For text both in italic and bold.

Value

A ggplot2 object.

Examples

```

# Check Suggests.
value <- SCpubr:::check_suggests(function_name = "do_ExpressionHeatmap", passive = TRUE)

if (isTRUE(value)){
  # Consult the full documentation in https://enblacar.github.io/SCpubr-book/
  # Define your Seurat object.
  sample <- readRDS(system.file("extdata/seurat_dataset_example.rds", package = "SCpubr"))

  # Define list of genes.

)

```

Arguments

sample	Seurat A Seurat object, generated by CreateSeuratObject .
features	character Features to represent.
assay	character Assay to use. Defaults to the current assay.
reduction	character Reduction to use. Can be the canonical ones such as "umap", "pca", or any custom ones, such as "diffusion". If you are unsure about which reductions you have, use <code>Seurat::Reductions(sample)</code> . Defaults to "umap" if present or to the last computed reduction if the argument is not provided.
slot	character Data slot to use. Only one of: counts, data, scale.data. Defaults to "data".

order	<code>logical</code> Whether to order the cells based on expression.
group.by	<code>character</code> Metadata variable based on which cells are grouped. This will effectively introduce a big dot in the center of each cluster, colored using a categorical color scale or with the values provided by the user in <code>group.by.colors.use</code> . It will also displays a legend.
group.by.colors.use	<code>character</code> Colors to use for the group dots.
colorblind	<code>logical</code> Whether to use colorblind-friendly colors for categorical variables. In place when <code>colors.use</code> is not used. Allows for a maximum of 85 different classes within a categorical variable.
group.by.legend	<code>character</code> Title for the legend when <code>group.by</code> is used. Use NA to disable it and NULL to use the default column title provided in <code>group.by</code> .
group.by.show.dots	<code>logical</code> Controls whether to place in the middle of the groups.
group.by.dot.size	<code>numeric</code> Size of the dots placed in the middle of the groups.
group.by.cell_borders	<code>logical</code> Plots another border around the cells displaying the same color code of the dots displayed with <code>group.by</code> . Legend is shown always with alpha = 1 regardless of the alpha settings.
group.by.cell_borders.alpha	<code>numeric</code> Controls the transparency of the new borders drawn by <code>group.by.cell_borders</code> .
split.by	<code>character</code> Secondary metadata variable to further group (split) the output by. Has to be a character of factor column.
idents.keep	<code>character</code> Vector of identities to plot. The gradient scale will also be subset to only the values of such identities.
cells.highlight, idents.highlight	<code>character</code> Vector of cells/identities to focus into. The identities have to much those in <code>Seurat::Idents(sample)</code> The rest of the cells will be grayed out. Both parameters can be used at the same time.
dims	<code>numeric</code> Vector of 2 numerics indicating the dimensions to plot out of the selected reduction. Defaults to c(1, 2) if not specified.
enforce_symmetry	<code>logical</code> Return a symmetrical plot axes-wise or continuous color scale-wise, when applicable.
symmetry.type	<code>character</code> Type of symmetry to be enforced. One of: <ul style="list-style-type: none"> • absolute: The highest absolute value will be taken into account to generate the color scale. Works after <code>min.cutoff</code> and <code>max.cutoff</code>. • centered: Centers the scale around the provided value in <code>symmetry.center</code>. Works after <code>min.cutoff</code> and <code>max.cutoff</code>.
symmetry.center	<code>numeric</code> Value upon which the scale will be centered.
pt.size	<code>numeric</code> Size of the dots.

font.size	<code>numeric</code> Overall font size of the plot. All plot elements will have a size relationship with this font size.
font.type	<code>character</code> Base font family for the plot. One of: <ul style="list-style-type: none">• <code>mono</code>: Mono spaced font.• <code>serif</code>: Serif font family.• <code>sans</code>: Default font family.
legend.title	<code>character</code> Title for the legend.
legend.type	<code>character</code> Type of legend to display. One of: <ul style="list-style-type: none">• <code>normal</code>: Default legend displayed by <code>ggplot2</code>.• <code>colorbar</code>: Redefined colorbar legend, using <code>guide_colorbar</code>.
legend.position	<code>character</code> Position of the legend in the plot. One of: <ul style="list-style-type: none">• <code>top</code>: Top of the figure.• <code>bottom</code>: Bottom of the figure.• <code>left</code>: Left of the figure.• <code>right</code>: Right of the figure.• <code>none</code>: No legend is displayed.
legend.framewidth, legend.tickwidth	<code>numeric</code> Width of the lines of the box in the legend.
legend.length, legend.width	<code>numeric</code> Length and width of the legend. Will adjust automatically depending on legend side.
legend.framecolor	<code>character</code> Color of the lines of the box in the legend.
legend.tickcolor	<code>character</code> Color of the ticks of the box in the legend.
legend.ncol	<code>numeric</code> Number of columns in the legend.
legend.nrow	<code>numeric</code> Number of rows in the legend.
legend.byrow	<code>logical</code> Whether the legend is filled by row or not.
plot.title, plot.subtitle, plot.caption	<code>character</code> Title, subtitle or caption to use in the plot.
individual.titles, individual.subtitles, individual.captions	<code>character</code> Titles or subtitles. for each feature if needed. Either NULL or a vector of equal length of features.
ncol	<code>numeric</code> Number of columns used in the arrangement of the output plot using "split.by" parameter.
use_viridis	<code>logical</code> Whether to use viridis color scales.
viridis.palette	<code>character</code> A capital letter from A to H or the scale name as in <code>scale_fill_viridis</code> .
viridis.direction	<code>numeric</code> Either 1 or -1. Controls how the gradient of viridis scale is formed.

<code>raster</code>	<code>logical</code> Whether to raster the resulting plot. This is recommendable if plotting a lot of cells.
<code>raster.dpi</code>	<code>numeric</code> Pixel resolution for rasterized plots. Defaults to 1024. Only activates on Seurat versions higher or equal than 4.1.0.
<code>plot_cell_borders</code>	<code>logical</code> Whether to plot border around cells.
<code>border.size</code>	<code>numeric</code> Width of the border of the cells.
<code>border.color</code>	<code>character</code> Color for the border of the heatmap body.
<code>border.density</code>	<code>numeric</code> Controls the number of cells used when <code>plot_cell_borders = TRUE</code> . Value between 0 and 1. It computes a 2D kernel density and based on this cells that have a density below the specified quantile will be used to generate the cluster contour. The lower this number, the less cells will be selected, thus reducing the overall size of the plot but also potentially preventing all the contours to be properly drawn.
<code>na.value</code>	<code>character</code> Color value for NA.
<code>verbose</code>	<code>logical</code> Whether to show extra comments, warnings,etc.
<code>plot.axes</code>	<code>logical</code> Whether to plot axes or not.
<code>min.cutoff, max.cutoff</code>	<code>numeric</code> Set the min/max ends of the color scale. Any cell/group with a value lower than <code>min.cutoff</code> will turn into <code>min.cutoff</code> and any cell with a value higher than <code>max.cutoff</code> will turn into <code>max.cutoff</code> . In FeaturePlots, provide as many values as features. Use NAs to skip a feature.
<code>scale.limits</code>	<code>numeric</code> Vector of two values (i.e: <code>c(0, 1)</code>) to limit the scales. Particularly useful to extend the color scale beyond the values in the dataset, contrary to <code>min.cutoff</code> and <code>max.cutoff</code> .
<code>plot_density_contour</code>	<code>logical</code> Whether to plot density contours in the UMAP.
<code>contour.position</code>	<code>character</code> Whether to plot density contours on top or at the bottom of the visualization layers, thus overlapping the clusters/cells or not.
<code>contour.color</code>	<code>character</code> Color of the density lines.
<code>contour.lineend</code>	<code>character</code> Line end style (round, butt, square).
<code>contour.linejoin</code>	<code>character</code> Line join style (round, mitre, bevel).
<code>contour_expand_axes</code>	<code>numeric</code> To make the contours fit the plot, the limits of the X and Y axis are expanding a given percentage from the min and max values for each axis. This controls such percentage.
<code>label</code>	<code>logical</code> Whether to plot the cluster labels in the UMAP. The cluster labels will have the same color as the cluster colors.
<code>label.color</code>	<code>character</code> Color of the labels in the plot.
<code>label.size</code>	<code>numeric</code> Size of the labels in the plot.

```

number.breaks  numeric | Controls the number of breaks in continuous color scales of ggplot2-
based plots.

diverging.palette
    character | Type of symmetrical color palette to use. Out of the diverging
palettes defined in brewer.pal.

diverging.direction
    numeric | Either 1 or -1. Direction of the diverging palette. This basically flips
the two ends.

sequential.palette
    character | Type of sequential color palette to use. Out of the sequential
palettes defined in brewer.pal.

sequential.direction
    numeric | Direction of the sequential color scale. Either 1 or -1.

plot.title.face,      plot.subtitle.face,      plot.caption.face,
axis.title.face, axis.text.face, legend.title.face, legend.text.face
    character | Controls the style of the font for the corresponding theme element.
One of:

- plain: For normal text.
- italic: For text in italic.
- bold: For text in bold.
- bold.italic: For text both in italic and bold.

```

Value

A ggplot2 object containing a Feature Plot.

Examples

```

# Check Suggests.
value <- SCpubr:::check_suggests(function_name = "do_FeaturePlot", passive = TRUE)

if (isTRUE(value)){
    # Consult the full documentation in https://enblacar.github.io/SCpubr-book/

)

```

Arguments

sample	<code>Seurat</code> A Seurat object, generated by CreateSeuratObject .
de_genes	<code>tibble</code> DE genes matrix resulting of running <code>Seurat::FindAllMarkers()</code> .
group.by	<code>character</code> Metadata variable to group the output by. Has to be a character or factor column.
assay	<code>character</code> Assay to use. Defaults to the current assay.
slot	<code>character</code> Data slot to use. Only one of: counts, data, scale.data. Defaults to "data".
number.breaks	<code>numeric</code> Controls the number of breaks in continuous color scales of ggplot2-based plots.
dot.scale	<code>numeric</code> Scale the size of the dots.
top_genes	<code>numeric</code> Top N differentially expressed (DE) genes by group to retrieve.
p.cutoff	<code>numeric</code> Cutoff to use for adjusted p.value to filter significant genes.
flip	<code>logical</code> Whether to invert the axis of the displayed plot.
plot.title, plot.subtitle, plot.caption	<code>character</code> Title, subtitle or caption to use in the plot.
xlab, ylab	<code>character</code> Titles for the X and Y axis.
use_viridis	<code>logical</code> Whether to use viridis color scales.

colors.use **named_vector** | Named vector of valid color representations (either name of HEX codes) with as many named colors as unique values of group.by. If group.by is not provided, defaults to the unique values of **Idents**. If not provided, a color scale will be set by default.

colorblind **logical** | Whether to use colorblind-friendly colors for categorical variables. In place when colors.use is not used. Allows for a maximum of 85 different classes within a categorical variable.

viridis.direction **numeric** | Either 1 or -1. Controls how the gradient of viridis scale is formed.

viridis.palette **character** | A capital letter from A to H or the scale name as in **scale_fill_viridis**.

sequential.direction **numeric** | Direction of the sequential color scale. Either 1 or -1.

sequential.palette **character** | Type of sequential color palette to use. Out of the sequential palettes defined in **brewer.pal**.

diverging.palette **character** | Type of symmetrical color palette to use. Out of the diverging palettes defined in **brewer.pal**.

diverging.direction **numeric** | Either 1 or -1. Direction of the diverging palette. This basically flips the two ends.

legend.position **character** | Position of the legend in the plot. One of:

- top: Top of the figure.
- bottom: Bottom of the figure.
- left: Left of the figure.
- right: Right of the figure.
- none: No legend is displayed.

legend.title **character** | Title for the legend.

legend.length, legend.width **numeric** | Length and width of the legend. Will adjust automatically depending on legend side.

legend.framewidth, legend.tickwidth **numeric** | Width of the lines of the box in the legend.

legend.framecolor **character** | Color of the lines of the box in the legend.

legend.tickcolor **character** | Color of the ticks of the box in the legend.

legend.ncol **numeric** | Number of columns in the legend.

legend.nrow **numeric** | Number of rows in the legend.

legend.byrow **logical** | Whether the legend is filled by row or not.

legend.type **character** | Type of legend to display. One of:

	<ul style="list-style-type: none"> • normal: Default legend displayed by ggplot2. • colorbar: Redefined colorbar legend, using guide_colorbar.
font.size	numeric Overall font size of the plot. All plot elements will have a size relationship with this font size.
font.type	character Base font family for the plot. One of: <ul style="list-style-type: none"> • mono: Mono spaced font. • serif: Serif font family. • sans: Default font family.
axis.text.x.angle	numeric Degree to rotate the X labels. One of: 0, 45, 90.
min.cutoff, max.cutoff	numeric Set the min/max ends of the color scale. Any cell/group with a value lower than min.cutoff will turn into min.cutoff and any cell with a value higher than max.cutoff will turn into max.cutoff. In FeaturePlots, provide as many values as features. Use NAs to skip a feature.
enforce_symmetry	logical Return a symmetrical plot axes-wise or continuous color scale-wise, when applicable.
na.value	character Color value for NA.
border.color	character Color for the border of the heatmap body.
plot.title.face, plot.subtitle.face, plot.caption.face, axis.title.face, axis.text.face, legend.title.face, legend.text.face	character Controls the style of the font for the corresponding theme element. One of: <ul style="list-style-type: none"> • plain: For normal text. • italic: For text in italic. • bold: For text in bold. • bold.italic: For text both in italic and bold.

Value

A dotplot composed of 3 main panels: -log10(adjusted p-value), log2(FC) and mean expression by cluster.

Examples

```
# Check Suggests.
value <- SCpubr:::check_suggests(function_name = "do_GroupwiseDEHeatmap", passive = TRUE)

if (isTRUE(value)){
  # Consult the full documentation in https://enblacar.github.io/SCpubr-book/
  
  # Define your Seurat object.
  sample <- readRDS(system.file("extdata/seurat_dataset_example.rds", package = "SCpubr"))

  # Compute DE genes and transform to a tibble.
```

```

de_genes <- readRDS(system.file("extdata/de_genes_example.rds", package = "SCpubr"))

# Default output.
p <- SCpubr::do_GroupwiseDEHeatmap(sample = sample,
                                      de_genes = de_genes)

p

} else if (base::isFALSE(value)){
  message("This function can not be used without its suggested packages.")
  message("Check out which ones are needed using `SCpubr::state_dependencies()`")
}

```

do_LigandReceptorPlot *Visualize Ligand-Receptor analysis output.*

Description

This function takes the output of liana and generates a dot-plot visualization according to the user's specifications.

Usage

```

do_LigandReceptorPlot(
  liana_output,
  split_by = NULL,
  keep_source = NULL,
  keep_target = NULL,
  top_interactions = 25,
  top_interactions_by_group = FALSE,
  dot_border = TRUE,
  magnitude = "sca.LRscore",
  specificity = "aggregate_rank",
  sort_by = "E",
  sorting.type.specificity = "descending",
  sorting.type.magnitude = "descending",
  border.color = "black",
  axis.text.x.angle = 45,
  legend.position = "bottom",
  legend.type = "colorbar",
  legend.length = 20,
  legend.width = 1,
  legend.framecolor = "grey50",
  legend.tickcolor = "white",
  legend.framewidth = 0.5,
  legend.tickwidth = 0.5,
  use_viridis = FALSE,

```

```

viridis.palette = "G",
viridis.direction = 1,
sequential.palette = "YlGnBu",
sequential.direction = 1,
font.size = 14,
dot.size = 1,
font.type = "sans",
plot.grid = TRUE,
grid.color = "grey90",
grid.type = "dotted",
compute_ChordDiagrams = FALSE,
sort_interactions_alphabetically = FALSE,
number.breaks = 5,
plot.title.face = "bold",
plot.subtitle.face = "plain",
plot.caption.face = "italic",
axis.title.face = "bold",
axis.text.face = "plain",
legend.title.face = "bold",
legend.text.face = "plain",
return_interactions = FALSE,
invert_specificity = TRUE,
invert_magnitude = FALSE,
verbose = TRUE
)

```

Arguments

liana_output	<code>tibble</code> Object resulting from running liana::liana_wrap and liana::liana_aggregate.
split.by	<code>character</code> Whether to further facet the plot on the y axis by common ligand.complex or receptor.complex. Values to provide: NULL, ligand.complex, receptor.complex.
keep_source, keep_target	<code>character</code> Identities to keep for the source/target of the interactions. NULL otherwise.
top_interactions	<code>numeric</code> Number of unique interactions to retrieve ordered by magnitude and specificity. It does not necessarily mean that the output will contain as many, but rather an approximate value.
top_interactions_by_group	<code>logical</code> Enforce the value on top_interactions to be applied to each group in source column.
dot_border	<code>logical</code> Whether to draw a black border in the dots.
specificity, magnitude	<code>character</code> Which columns to use for specificity and magnitude.
sort.by	<code>character</code> How to arrange the top interactions. Interactions are sorted and then the top N are retrieved and displayed. This takes place after subsetting for keep_source and keep_target One of:

- A: Sorts by specificity.
- B: Sorts by magnitude.
- C: Sorts by specificity, then magnitude (gives extra weight to specificity).
- D: Sorts by magnitude, then specificity (gives extra weight to magnitude). Might lead to the display of non-significant results.
- E: Sorts by specificity and magnitude equally.

`sorting.type.specification, sorting.type.magnitude`

`character` | Whether the sorting of e magnitude or specification columns is done in ascending or descending order. This synergises with the value of e `invert_specificity` and e `invert_magnitude` parameters.

`border.color` `character` | Color for the border of the heatmap body.

`axis.text.x.angle`

`numeric` | Degree to rotate the X labels. One of: 0, 45, 90.

`legend.position`

`character` | Position of the legend in the plot. One of:

- top: Top of the figure.
- bottom: Bottom of the figure.
- left: Left of the figure.
- right: Right of the figure.
- none: No legend is displayed.

`legend.type` `character` | Type of legend to display. One of:

- normal: Default legend displayed by `ggplot2`.
- colorbar: Redefined colorbar legend, using `guide_colorbar`.

`legend.length, legend.width`

`numeric` | Length and width of the legend. Will adjust automatically depending on legend side.

`legend.framecolor`

`character` | Color of the lines of the box in the legend.

`legend.tickcolor`

`character` | Color of the ticks of the box in the legend.

`legend.framewidth, legend.tickwidth`

`numeric` | Width of the lines of the box in the legend.

`use_viridis` `logical` | Whether to use viridis color scales.

`viridis.palette`

`character` | A capital letter from A to H or the scale name as in `scale_fill_viridis`.

`viridis.direction`

`numeric` | Either 1 or -1. Controls how the gradient of viridis scale is formed.

`sequential.palette`

`character` | Type of sequential color palette to use. Out of the sequential palettes defined in `brewer.pal`.

`sequential.direction`

`numeric` | Direction of the sequential color scale. Either 1 or -1.

`font.size` `numeric` | Overall font size of the plot. All plot elements will have a size relationship with this font size.

```

dot.size      numeric | Size aesthetic for the dots.
font.type     character | Base font family for the plot. One of:
                      • mono: Mono spaced font.
                      • serif: Serif font family.
                      • sans: Default font family.
plot.grid     logical | Whether to plot grid lines.
grid.color    character | Color of the grid in the plot. In heatmaps, color of the border of the
                      cells.
grid.type     character | One of the possible linetype options:
                      • blank.
                      • solid.
                      • dashed.
                      • dotted.
                      • dotdash.
                      • longdash.
                      • twodash.
compute_ChordDiagrams
                      logical | Whether to also compute Chord Diagrams for both the number of
                      interactions between source and target but also between ligand.complex and re-
                      ceptor.complex.
sort_interactions_alphabetically
                      logical | Sort the interactions to be plotted alphabetically (TRUE) or keep them
                      in their original order in the matrix (FALSE).
number.breaks   numeric | Controls the number of breaks in continuous color scales of ggplot2-
                      based plots.
plot.title.face,       plot.subtitle.face,       plot.caption.face,
axis.title.face, axis.text.face, legend.title.face, legend.text.face
                      character | Controls the style of the font for the corresponding theme element.
                      One of:
                      • plain: For normal text.
                      • italic: For text in italic.
                      • bold: For text in bold.
                      • bold.italic: For text both in italic and bold.
return_interactions
                      logical | Whether to return the data.frames with the interactions so that they
                      can be plotted as chord plots using other package functions.
invert_specificity, invert_magnitude
                      logical | Whether to -log10 transform specificity and magnitude columns.
verbose        logical | Whether to show extra comments, warnings,etc.

```

Value

A ggplot2 plot with the results of the Ligand-Receptor analysis.

Examples

```
# Check Suggests.
value <- SCpubr:::check_suggests(function_name = "do_LigandReceptorPlot", passive = TRUE)

if (isTRUE(value)){
  liana_output <- readRDS(system.file("extdata/liana_output_example.rds", package = "SCpubr"))
  # Ligand Receptor analysis plot.
  p <- SCpubr::do_LigandReceptorPlot(liana_output = liana_output)
  p

} else if (base::isFALSE(value)){
  message("This function can not be used without its suggested packages.")
  message("Check out which ones are needed using `SCpubr::state_dependencies()`")
}
```

do_LoadingsHeatmap *Compute a heatmap summary of the top and bottom genes in the PCA loadings for the desired PCs in a Seurat object.*

Description

Compute a heatmap summary of the top and bottom genes in the PCA loadings for the desired PCs in a Seurat object.

Usage

```
do_LoadingsHeatmap(
  sample,
  group.by = NULL,
  subsample = NA,
  dims = 1:10,
  top_loadings = 5,
  assay = NULL,
  slot = "data",
  grid.color = "white",
  border.color = "black",
  number.breaks = 5,
  na.value = "grey75",
  legend.position = "bottom",
  legend.title = "Expression",
  legend.type = "colorbar",
  legend.framewidth = 0.5,
  legend.tickwidth = 0.5,
  legend.length = 20,
  legend.width = 1,
  legend.framecolor = "grey50",
```

```

    legend.tickcolor = "white",
    font.size = 14,
    font.type = "sans",
    axis.text.x.angle = 45,
    use_viridis = FALSE,
    sequential.direction = 1,
    sequential.palette = "YlGnBu",
    viridis.palette = "G",
    viridis.direction = -1,
    diverging.palette = "RdBu",
    diverging.direction = -1,
    min.cutoff.loadings = NA,
    max.cutoff.loadings = NA,
    min.cutoff.expression = NA,
    max.cutoff.expression = NA,
    plot.title.face = "bold",
    plot.subtitle.face = "plain",
    plot.caption.face = "italic",
    axis.title.face = "bold",
    axis.text.face = "plain",
    legend.title.face = "bold",
    legend.text.face = "plain"
)

```

Arguments

sample	<code>Seurat</code> A Seurat object, generated by CreateSeuratObject .
group.by	<code>character</code> Metadata variable to group the output by. Has to be a character or factor column.
subsample	<code>numeric</code> Number of cells to subsample the Seurat object to increase computational speed. Use NA to include the Seurat object as is.
dims	<code>numeric</code> PCs to include in the analysis.
top_loadings	<code>numeric</code> Number of top and bottom scored genes in the PCA Loadings for each PC.
assay	<code>character</code> Assay to use. Defaults to the current assay.
slot	<code>character</code> Data slot to use. Only one of: counts, data, scale.data. Defaults to "data".
grid.color	<code>character</code> Color of the grid in the plot. In heatmaps, color of the border of the cells.
border.color	<code>character</code> Color for the border of the heatmap body.
number.breaks	<code>numeric</code> Controls the number of breaks in continuous color scales of ggplot2-based plots.
na.value	<code>character</code> Color value for NA.
legend.position	<code>character</code> Position of the legend in the plot. One of:

- **top**: Top of the figure.
 - **bottom**: Bottom of the figure.
 - **left**: Left of the figure.
 - **right**: Right of the figure.
 - **none**: No legend is displayed.
- legend.title** `character` | Title for the legend.
- legend.type** `character` | Type of legend to display. One of:
 - **normal**: Default legend displayed by `ggplot2`.
 - **colorbar**: Redefined colorbar legend, using `guide_colorbar`.
- legend.framewidth**, **legend.tickwidth**
`numeric` | Width of the lines of the box in the legend.
- legend.length**, **legend.width**
`numeric` | Length and width of the legend. Will adjust automatically depending on legend side.
- legend.framecolor**
`character` | Color of the lines of the box in the legend.
- legend.tickcolor**
`character` | Color of the ticks of the box in the legend.
- font.size** `numeric` | Overall font size of the plot. All plot elements will have a size relationship with this font size.
- font.type** `character` | Base font family for the plot. One of:
 - **mono**: Mono spaced font.
 - **serif**: Serif font family.
 - **sans**: Default font family.
- axis.text.x.angle**
`numeric` | Degree to rotate the X labels. One of: 0, 45, 90.
- use_viridis** `logical` | Whether to use viridis color scales.
- sequential.direction**
`numeric` | Direction of the sequential color scale. Either 1 or -1.
- sequential.palette**
`character` | Type of sequential color palette to use. Out of the sequential palettes defined in `brewer.pal`.
- viridis.palette**
`character` | A capital letter from A to H or the scale name as in `scale_fill_viridis`.
- viridis.direction**
`numeric` | Either 1 or -1. Controls how the gradient of viridis scale is formed.
- diverging.palette**
`character` | Type of symmetrical color palette to use. Out of the diverging palettes defined in `brewer.pal`.
- diverging.direction**
`numeric` | Either 1 or -1. Direction of the diverging palette. This basically flips the two ends.

```

min.cutoff.loadings, max.cutoff.loadings
    numeric | Cutoff to subset the scale of the Loading score heatmap. NA will use
    quantiles 0.05 and 0.95.

min.cutoff.expression, max.cutoff.expression
    numeric | Cutoff to subset the scale of the expression heatmap. NA will use 0
    (no quantile) and quantile 0.95.

plot.title.face, plot.subtitle.face, plot.caption.face,
axis.title.face, axis.text.face, legend.title.face, legend.text.face
    character | Controls the style of the font for the corresponding theme element.
One of:
    • plain: For normal text.
    • italic: For text in italic.
    • bold: For text in bold.
    • bold.italic: For text both in italic and bold.

```

Value

A ggplot2 object.

Examples

```

# Check Suggests.
value <- SCpubr:::check_suggests(function_name = "do_LoadingsHeatmap", passive = TRUE)

if (isTRUE(value)){
  # Consult the full documentation in https://enblacar.github.io/SCpubr-book/
  # Define your Seurat object.
  sample <- readRDS(system.file("extdata/seurat_dataset_example.rds", package = "SCpubr"))

  p <- SCpubr::do_LoadingsHeatmap(sample = sample,
                                    dims = 1:2)
  p

} else if (base::isFALSE(value)){
  message("This function can not be used without its suggested packages.")
  message("Check out which ones are needed using `SCpubr::state_dependencies()`")
}

```

do_MetadataHeatmap *Compute a heatmap of categorical variables.*

Description

The main use of this function is to generate a metadata heatmap of your categorical data, normally targeted to the different patient samples one has in the Seurat object. It requires that the metadata columns chosen have one and only one possible value for each of the values in group.by.

Usage

```
do_MetadataHeatmap(
  sample = NULL,
  group.by = NULL,
  metadata = NULL,
  from_df = FALSE,
  df = NULL,
  colors.use = NULL,
  colorblind = FALSE,
  cluster = FALSE,
  flip = TRUE,
  heatmap.gap = 1,
  axis.text.x.angle = 45,
  legend.position = "bottom",
  font.size = 14,
  legend.font.size = NULL,
  legend.symbol.size = NULL,
  legend.ncol = NULL,
  legend.nrow = NULL,
  legend.byrow = FALSE,
  na.value = "grey75",
  font.type = "sans",
  grid.color = "white",
  border.color = "black",
  plot.title.face = "bold",
  plot.subtitle.face = "plain",
  plot.caption.face = "italic",
  axis.title.face = "bold",
  axis.text.face = "plain",
  legend.title.face = "bold",
  legend.text.face = "plain",
  xlab = "",
  ylab = ""
)
```

Arguments

<code>sample</code>	<code>Seurat</code> A Seurat object, generated by CreateSeuratObject .
<code>group.by</code>	<code>character</code> Metadata column to use as basis for the plot.
<code>metadata</code>	<code>character</code> Metadata columns that will be used to plot the heatmap on the basis of the variable provided to <code>group.by</code> .
<code>from_df</code>	<code>logical</code> Whether to provide a data frame with the metadata instead.
<code>df</code>	<code>data.frame</code> Data frame containing the metadata to plot. Rows contain the unique values common to all columns (metadata variables). The columns must be named.
<code>colors.use</code>	<code>named_list</code> A named list of named vectors. The names of the list correspond to the names of the values provided to <code>metadata</code> and the names of the items

in the named vectors correspond to the unique values of that specific metadata variable. The values are the desired colors in HEX code for the values to plot. The used are pre-defined by the package but, in order to get the most out of the plot, please provide your custom set of colors for each metadata column!

colorblind	<code>logical</code> Whether to use colorblind-friendly colors for categorical variables. In place when <code>colors.use</code> is not used. Allows for a maximum of 85 different classes within a categorical variable.
cluster	<code>logical</code> Whether to perform clustering of rows and columns.
flip	<code>logical</code> Whether to invert the axis of the displayed plot.
heatmap.gap	<code>numeric</code> Size of the gap between heatmaps in mm.
axis.text.x.angle	<code>numeric</code> Degree to rotate the X labels. One of: 0, 45, 90.
legend.position	<code>character</code> Position of the legend in the plot. One of: <ul style="list-style-type: none"> • top: Top of the figure. • bottom: Bottom of the figure. • left: Left of the figure. • right: Right of the figure. • none: No legend is displayed.
font.size	<code>numeric</code> Overall font size of the plot. All plot elements will have a size relationship with this font size.
legend.font.size	<code>numeric</code> Size of the font size of the legend. NULL uses default theme font size for legend according to the <code>font.size</code> parameter.
legend.symbol.size	<code>numeric</code> Size of symbols in the legend in mm. NULL uses the default size.
legend.ncol	<code>numeric</code> Number of columns in the legend.
legend.nrow	<code>numeric</code> Number of rows in the legend.
legend.byrow	<code>logical</code> Whether the legend is filled by row or not.
na.value	<code>character</code> Color value for NA.
font.type	<code>character</code> Base font family for the plot. One of: <ul style="list-style-type: none"> • mono: Mono spaced font. • serif: Serif font family. • sans: Default font family.
grid.color	<code>character</code> Color of the grid in the plot. In heatmaps, color of the border of the cells.
border.color	<code>character</code> Color for the border of the heatmap body.
plot.title.face, plot.subtitle.face, plot.caption.face, axis.title.face, axis.text.face, legend.title.face, legend.text.face	<code>character</code> Controls the style of the font for the corresponding theme element. One of: <ul style="list-style-type: none"> • plain: For normal text.

- **italic**: For text in italic.
 - **bold**: For text in bold.
 - **bold.italic**: For text both in italic and bold.
- xlab, ylab** **character** | Titles for the X and Y axis.

Value

A ggplot2 object.

Examples

```
# Check Suggests.
value <- SCpubr:::check_suggests(function_name = "do_MetadataHeatmap", passive = TRUE)

if (isTRUE(value)){
  # Consult the full documentation in https://enblacar.github.io/SCpubr-book/
  # Can also use a Seurat object.
  df <- data.frame(row.names = letters[1:5],
                    "A" = as.character(seq(1, 5)),
                    "B" = rev(as.character(seq(1, 5))))
  p <- SCpubr:::do_MetadataHeatmap(from_df = TRUE,
                                    df = df)
  p
} else if (base::isFALSE(value)){
  message("This function can not be used without its suggested packages.")
  message("Check out which ones are needed using `SCpubr::state_dependencies()`")
}
```

do_NebulosaPlot *Wrapper for Nebulosa::plot_density in Seurat.*

Description

Wrapper for Nebulosa::plot_density in Seurat.

Usage

```
do_NebulosaPlot(
  sample,
  features,
  slot = NULL,
  dims = c(1, 2),
  pt.size = 1,
```

```

reduction = NULL,
combine = TRUE,
method = c("ks", "wkde"),
joint = FALSE,
return_only_joint = FALSE,
plot.title = NULL,
plot.subtitle = NULL,
plot.caption = NULL,
legend.type = "colorbar",
legend.framewidth = 0.5,
legend.tickwidth = 0.5,
legend.length = 20,
legend.width = 1,
legend.framecolor = "grey50",
legend.tickcolor = "white",
font.size = 14,
font.type = "sans",
legend.position = "bottom",
plot_cell_borders = TRUE,
border.size = 2,
border.color = "black",
viridis.palette = "G",
viridis.direction = 1,
verbose = TRUE,
na.value = "grey75",
plot.axes = FALSE,
number.breaks = 5,
use_viridis = FALSE,
sequential.palette = "YlGnBu",
sequential.direction = 1,
plot.title.face = "bold",
plot.subtitle.face = "plain",
plot.caption.face = "italic",
axis.title.face = "bold",
axis.text.face = "plain",
legend.title.face = "bold",
legend.text.face = "plain"
)

```

Arguments

<code>sample</code>	<code>Seurat</code> A Seurat object, generated by CreateSeuratObject .
<code>features</code>	<code>character</code> Features to represent.
<code>slot</code>	<code>character</code> Data slot to use. Only one of: counts, data, scale.data. Defaults to "data".
<code>dims</code>	<code>numeric</code> Vector of 2 numerics indicating the dimensions to plot out of the selected reduction. Defaults to c(1, 2) if not specified.
<code>pt.size</code>	<code>numeric</code> Size of the dots.

reduction	character Reduction to use. Can be the canonical ones such as "umap", "pca", or any custom ones, such as "diffusion". If you are unsure about which reductions you have, use Seurat::Reductions(sample). Defaults to "umap" if present or to the last computed reduction if the argument is not provided.
combine	logical Whether to create a single plot out of multiple features.
method	Kernel density estimation method: <ul style="list-style-type: none"> • ks: Computes density using the kde function from the ks package. • wkde: Computes density using a modified version of the kde2d function from the MASS package to allow weights. Bandwidth selection from the ks package is used instead.
joint	logical Whether to plot different features as joint density.
return_only_joint	logical Whether to only return the joint density panel.
plot.title, plot.subtitle, plot.caption	character Title, subtitle or caption to use in the plot.
legend.type	character Type of legend to display. One of: <ul style="list-style-type: none"> • normal: Default legend displayed by ggplot2. • colorbar: Redefined colorbar legend, using guide_colorbar.
legend.framewidth, legend.tickwidth	numeric Width of the lines of the box in the legend.
legend.length, legend.width	numeric Length and width of the legend. Will adjust automatically depending on legend side.
legend.framecolor	character Color of the lines of the box in the legend.
legend.tickcolor	character Color of the ticks of the box in the legend.
font.size	numeric Overall font size of the plot. All plot elements will have a size relationship with this font size.
font.type	character Base font family for the plot. One of: <ul style="list-style-type: none"> • mono: Mono spaced font. • serif: Serif font family. • sans: Default font family.
legend.position	character Position of the legend in the plot. One of: <ul style="list-style-type: none"> • top: Top of the figure. • bottom: Bottom of the figure. • left: Left of the figure. • right: Right of the figure. • none: No legend is displayed.
plot_cell_borders	logical Whether to plot border around cells.

```

border.size      numeric | Width of the border of the cells.
border.color     character | Color for the border of the heatmap body.
viridis.palette  character | A capital letter from A to H or the scale name as in scale_fill_viridis.
viridis.direction numeric | Either 1 or -1. Controls how the gradient of viridis scale is formed.
verbose          logical | Whether to show extra comments, warnings,etc.
na.value          character | Color value for NA.
plot.axes         logical | Whether to plot axes or not.
number.breaks    numeric | Controls the number of breaks in continuous color scales of ggplot2-based plots.
use_viridis       logical | Whether to use viridis color scales.
sequential.palette character | Type of sequential color palette to use. Out of the sequential palettes defined in brewer.pal.
sequential.direction numeric | Direction of the sequential color scale. Either 1 or -1.
plot.title.face,   plot.subtitle.face,   plot.caption.face,
axis.title.face, axis.text.face, legend.title.face, legend.text.face
                           character | Controls the style of the font for the corresponding theme element.
                           One of:
                           • plain: For normal text.
                           • italic: For text in italic.
                           • bold: For text in bold.
                           • bold.italic: For text both in italic and bold.

```

Value

A ggplot2 object containing a Nebulosa plot.

Examples

```

# Check Suggests.
value <- SCpubr:::check_suggests(function_name = "do_NebulosaPlot", passive = TRUE)

if (isTRUE(value)){
  # Consult the full documentation in https://enblacar.github.io/SCpubr-book/

  # Define your Seurat object.
  sample <- readRDS(system.file("extdata/seurat_dataset_example.rds", package = "SCpubr"))

  # Basic Nebulosa plot.
  p <- SCpubr::do_NebulosaPlot(sample = sample,
                                features = "EPC1")

  # Compute joint density.

```

```

p <- SCpubr::do_NebulosaPlot(sample = sample,
                               features = c("EPC1", "TOX2"),
                               joint = TRUE)

} else if (base::isFALSE(value)){
  message("This function can not be used without its suggested packages.")
  message("Check out which ones are needed using `SCpubr::state_dependencies()`")
}

```

do_PackageReport*Generate a status report of SCpubr and its dependencies.***Description**

This function generates a summary report of the installation status of SCpubr, which packages are still missing and which functions can or can not currently be used.

Usage

```
do_PackageReport(startup = FALSE, extended = FALSE)
```

Arguments

- | | |
|----------|---|
| startup | <code>logical</code> Whether the message should be displayed at startup, therefore, also containing welcoming messages and tips. If FALSE, only the report itself will be printed. |
| extended | <code>logical</code> Whether the message should also include installed packages, current and available version, and which SCpubr functions can be used with the currently installed packages. |

Value

None

Examples

```
# Print a package report.
SCpubr::do_PackageReport(startup = FALSE, extended = FALSE)
```

do_PathwayActivityHeatmap

Plot Pathway Activities from decoupleR using Progeny prior knowledge.

Description

Plot Pathway Activities from decoupleR using Progeny prior knowledge.

Usage

```
do_PathwayActivityHeatmap(  
  sample,  
  activities,  
  group.by = NULL,  
  split.by = NULL,  
  slot = "scale.data",  
  statistic = "norm_wmean",  
  pt.size = 1,  
  border.size = 2,  
  values.show = FALSE,  
  values.threshold = NULL,  
  values.size = 3,  
  values.round = 1,  
  na.value = "grey75",  
  legend.position = "bottom",  
  legend.width = 1,  
  legend.length = 20,  
  legend.framewidth = 0.5,  
  legend.tickwidth = 0.5,  
  legend.framecolor = "grey50",  
  legend.tickcolor = "white",  
  legend.type = "colorbar",  
  font.size = 14,  
  font.type = "sans",  
  axis.text.x.angle = 45,  
  enforce_symmetry = TRUE,  
  min.cutoff = NA,  
  max.cutoff = NA,  
  number.breaks = 5,  
  diverging.palette = "RdBu",  
  diverging.direction = -1,  
  use_viridis = FALSE,  
  viridis.palette = "G",  
  viridis.direction = -1,  
  sequential.palette = "YlGnBu",  
  sequential.direction = 1,
```

```

flip = FALSE,
return_object = FALSE,
grid.color = "white",
border.color = "black",
plot.title.face = "bold",
plot.subtitle.face = "plain",
plot.caption.face = "italic",
axis.title.face = "bold",
axis.text.face = "plain",
legend.title.face = "bold",
legend.text.face = "plain"
)

```

Arguments

sample	<code>Seurat</code> A Seurat object, generated by CreateSeuratObject .
activities	<code>tibble</code> Result of running decoupleR method with progeny regulon prior knowledge.
group.by	<code>character</code> Metadata variable to group the output by. Has to be a character or factor column.
split.by	<code>character</code> Secondary metadata variable to further group (split) the output by. Has to be a character of factor column.
slot	<code>character</code> Data slot to use. Only one of: counts, data, scale.data. Defaults to "data".
statistic	<code>character</code> DecoupleR statistic to use. One of: <ul style="list-style-type: none"> • wmean: For weighted mean. • norm_wmean: For normalized weighted mean. • corr_wmean: For corrected weighted mean.
pt.size	<code>numeric</code> Size of the dots.
border.size	<code>numeric</code> Width of the border of the cells.
values.show	<code>logical</code> Whether to add values as text in the heatmap.
values.threshold	<code>numeric</code> Value from which the text color turns from black to white. If mode = "hvg", this is applied to both ends of the color scale.
values.size	<code>numeric</code> Size of the text labels.
values.round	<code>numeric</code> Decimal to which round the values to.
na.value	<code>character</code> Color value for NA.
legend.position	<code>character</code> Position of the legend in the plot. One of: <ul style="list-style-type: none"> • top: Top of the figure. • bottom: Bottom of the figure. • left: Left of the figure. • right: Right of the figure. • none: No legend is displayed.

```

legend.length, legend.width
    numeric | Length and width of the legend. Will adjust automatically depending
    on legend side.
legend.framewidth, legend.tickwidth
    numeric | Width of the lines of the box in the legend.
legend.framecolor
    character | Color of the lines of the box in the legend.
legend.tickcolor
    character | Color of the ticks of the box in the legend.
legend.type      character | Type of legend to display. One of:
    • normal: Default legend displayed by ggplot2.
    • colorbar: Redefined colorbar legend, using guide_colorbar.
font.size        numeric | Overall font size of the plot. All plot elements will have a size rela-
    tionship with this font size.
font.type         character | Base font family for the plot. One of:
    • mono: Mono spaced font.
    • serif: Serif font family.
    • sans: Default font family.
axis.text.x.angle
    numeric | Degree to rotate the X labels. One of: 0, 45, 90.
enforce_symmetry
    logical | Return a symmetrical plot axes-wise or continuous color scale-wise,
    when applicable.
min.cutoff, max.cutoff
    numeric | Set the min/max ends of the color scale. Any cell/group with a value
    lower than min.cutoff will turn into min.cutoff and any cell with a value higher
    than max.cutoff will turn into max.cutoff. In FeaturePlots, provide as many
    values as features. Use NAs to skip a feature.
number.breaks    numeric | Controls the number of breaks in continuous color scales of ggplot2-
    based plots.
diverging.palette
    character | Type of symmetrical color palette to use. Out of the diverging
    palettes defined in brewer.pal.
diverging.direction
    numeric | Either 1 or -1. Direction of the diverging palette. This basically flips
    the two ends.
use_viridis       logical | Whether to use viridis color scales.
viridis.palette
    character | A capital letter from A to H or the scale name as in scale_fill_viridis.
viridis.direction
    numeric | Either 1 or -1. Controls how the gradient of viridis scale is formed.
sequential.palette
    character | Type of sequential color palette to use. Out of the sequential
    palettes defined in brewer.pal.

```

```

sequential.direction
  numeric | Direction of the sequential color scale. Either 1 or -1.
flip
  logical | Whether to invert the axis of the displayed plot.
return_object
  logical | Returns the Seurat object with the modifications performed in the
  function. Normally, this contains a new assay with the data that can then be used
  for any other visualization desired.
grid.color
  character | Color of the grid in the plot. In heatmaps, color of the border of the
  cells.
border.color
  character | Color for the border of the heatmap body.
plot.title.face, plot.subtitle.face, plot.caption.face,
axis.title.face, axis.text.face, legend.title.face, legend.text.face
  character | Controls the style of the font for the corresponding theme element.
  One of:
    • plain: For normal text.
    • italic: For text in italic.
    • bold: For text in bold.
    • bold.italic: For text both in italic and bold.

```

Value

A ggplot2 object.

Examples

```

# Check Suggests.
value <- SCpubr:::check_suggests(function_name = "do_PathwayActivityHeatmap", passive = TRUE)

if (isTRUE(value)){

                                              activities = progeny_activities)
  p <- out$heatmaps$average_scores
  p

} else if (base::isFALSE(value)){
  message("This function can not be used without its suggested packages.")
  message("Check out which ones are needed using `SCpubr::state_dependencies()`")
}

```

```
do_RankedEnrichmentHeatmap
```

Compute a heatmap of enrichment of gene sets on the context of a dimensional reduction component.

Description

Compute a heatmap of enrichment of gene sets on the context of a dimensional reduction component.

Usage

```
do_RankedEnrichmentHeatmap(  
  sample,  
  input_gene_list,  
  assay = NULL,  
  slot = NULL,  
  scale.enrichment = TRUE,  
  dims = 1:2,  
  subsample = 2500,  
  reduction = NULL,  
  group.by = NULL,  
  colors.use = NULL,  
  colorblind = FALSE,  
  raster = FALSE,  
  interpolate = FALSE,  
  nbin = 24,  
  ctrl = 100,  
  flavor = "Seurat",  
  main.heatmap.size = 0.95,  
  enforce_symmetry = ifelse(isTRUE(scale.enrichment), TRUE, FALSE),  
  use_viridis = FALSE,  
  viridis.palette = "G",  
  viridis.direction = -1,  
  sequential.palette = "YlGnBu",  
  sequential.direction = 1,  
  font.size = 14,  
  font.type = "sans",  
  na.value = "grey75",  
  legend.width = 1,  
  legend.length = 20,  
  legend.framewidth = 0.5,  
  legend.tickwidth = 0.5,  
  legend.framecolor = "grey50",  
  legend.tickcolor = "white",  
  legend.type = "colorbar",  
  legend.position = "bottom",
```

```

legend.nrow = NULL,
legend.ncol = NULL,
legend.byrow = FALSE,
number.breaks = 5,
diverging.palette = "RdBu",
diverging.direction = -1,
axis.text.x.angle = 45,
border.color = "black",
return_object = FALSE,
verbose = FALSE,
plot.title.face = "bold",
plot.subtitle.face = "plain",
plot.caption.face = "italic",
axis.title.face = "bold",
axis.text.face = "plain",
legend.title.face = "bold",
legend.text.face = "plain"
)

```

Arguments

sample	<code>Seurat</code> A Seurat object, generated by CreateSeuratObject .
input_gene_list	<code>named_list</code> Named list of lists of genes to be used as input.
assay	<code>character</code> Assay to use. Defaults to the current assay.
slot	<code>character</code> Data slot to use. Only one of: counts, data, scale.data. Defaults to "data".
scale.enrichment	<code>logical</code> Should the enrichment scores be scaled (z-scored) for better comparison in between gene sets? Setting this to TRUE should make intra- gene set comparisons easier at the cost of not being able to compare inter- gene sets in absolute values.
dims	<code>numeric</code> Vector of 2 numerics indicating the dimensions to plot out of the selected reduction. Defaults to c(1, 2) if not specified.
subsample	<code>numeric</code> Number of cells to subset for the analysis. NA will use all. Cells are selected at random.
reduction	<code>character</code> Reduction to use. Can be the canonical ones such as "umap", "pca", or any custom ones, such as "diffusion". If you are unsure about which reductions you have, use <code>Seurat::Reductions(sample)</code> . Defaults to "umap" if present or to the last computed reduction if the argument is not provided.
group.by	<code>character</code> Metadata variable to group the output by. Has to be a character of factor column.
colors.use	<code>list</code> A named list of named vectors. The names of the list correspond to the names of the values provided to metadata and the names of the items in the named vectors correspond to the unique values of that specific metadata variable. The values are the desired colors in HEX code for the values to plot. The used

	are pre-defined by the package but, in order to get the most out of the plot, please provide your custom set of colors for each metadata column!
colorblind	<code>logical</code> Whether to use colorblind-friendly colors for categorical variables. In place when <code>colors.use</code> is not used. Allows for a maximum of 85 different classes within a categorical variable.
raster	<code>logical</code> Whether to raster the resulting plot. This is recommendable if plotting a lot of cells.
interpolate	<code>logical</code> Smoothes the output heatmap, saving space on disk when saving the image. However, the image is not as crisp.
nbin	<code>numeric</code> Number of bins to use in AddModuleScore .
ctrl	<code>numeric</code> Number of genes in the control set to use in AddModuleScore .
flavor	<code>character</code> One of: Seurat, UCell. Compute the enrichment scores using AddModuleScore or AddModuleScore_UCell .
main.heatmap.size	<code>numeric</code> A number from 0 to 1 corresponding to how big the main heatmap plot should be with regards to the rest (corresponds to the proportion in size).
enforce_symmetry	<code>logical</code> Return a symmetrical plot axes-wise or continuous color scale-wise, when applicable.
use_viridis	<code>logical</code> Whether to use viridis color scales.
viridis.palette	<code>character</code> A capital letter from A to H or the scale name as in <code>scale_fill_viridis</code> .
viridis.direction	<code>numeric</code> Either 1 or -1. Controls how the gradient of viridis scale is formed.
sequential.palette	<code>character</code> Type of sequential color palette to use. Out of the sequential palettes defined in <code>brewer.pal</code> .
sequential.direction	<code>numeric</code> Direction of the sequential color scale. Either 1 or -1.
font.size	<code>numeric</code> Overall font size of the plot. All plot elements will have a size relationship with this font size.
font.type	<code>character</code> Base font family for the plot. One of: <ul style="list-style-type: none"> • mono: Mono spaced font. • serif: Serif font family. • sans: Default font family.
na.value	<code>character</code> Color value for NA.
legend.length, legend.width	<code>numeric</code> Length and width of the legend. Will adjust automatically depending on legend side.
legend.framewidth, legend.tickwidth	<code>numeric</code> Width of the lines of the box in the legend.
legend.framecolor	<code>character</code> Color of the lines of the box in the legend.

```

legend.tickcolor      character | Color of the ticks of the box in the legend.
legend.type          character | Type of legend to display. One of:
                           • normal: Default legend displayed by ggplot2.
                           • colorbar: Redefined colorbar legend, using guide_colorbar.
legend.position       character | Position of the legend in the plot. One of:
                           • top: Top of the figure.
                           • bottom: Bottom of the figure.
                           • left: Left of the figure.
                           • right: Right of the figure.
                           • none: No legend is displayed.
legend.nrow           numeric | Number of rows in the legend.
legend.ncol           numeric | Number of columns in the legend.
legend.byrow          logical | Whether the legend is filled by row or not.
number.breaks         numeric | Controls the number of breaks in continuous color scales of ggplot2-based plots.
diverging.palette     character | Type of symmetrical color palette to use. Out of the diverging palettes defined in brewer.pal.
diverging.direction   numeric | Either 1 or -1. Direction of the diverging palette. This basically flips the two ends.
axis.text.x.angle     numeric | Degree to rotate the X labels. One of: 0, 45, 90.
border.color          character | Color for the border of the heatmap body.
return_object         logical | Returns the Seurat object with the modifications performed in the function. Normally, this contains a new assay with the data that can then be used for any other visualization desired.
verbose               logical | Whether to show extra comments, warnings,etc.
plot.title.face,      plot.subtitle.face,    plot.caption.face,
axis.title.face,      axis.text.face,        legend.title.face, legend.text.face
                           character | Controls the style of the font for the corresponding theme element. One of:
                           • plain: For normal text.
                           • italic: For text in italic.
                           • bold: For text in bold.
                           • bold.italic: For text both in italic and bold.

```

Value

A list of ggplot2 objects, one per dimensional reduction component, and a Seurat object if desired.

Examples

```

# Check Suggests.
value <- SCpubr:::check_suggests(function_name = "do_RankedEnrichmentHeatmap", passive = TRUE)

if (isTRUE(value)){
  # Consult the full documentation in https://enblacar.github.io/SCpubr-book/
  # Define your Seurat object.
  sample <- readRDS(system.file("extdata/seurat_dataset_example.rds", package = "SCpubr"))

  # Genes have to be unique.
  genes <- list("A" = rownames(sample)[1:5],
                "B" = rownames(sample)[6:10],
                "C" = rownames(sample)[11:15])

  # This will query, for the provided components, the enrichment of the gene
  # sets for all cells and plot them in the context of the cells reordered by
  # the position alongside each dimensional reduction component.
  p <- SCpubr:::do_RankedEnrichmentHeatmap(sample = sample,
                                              input_gene_list = genes,

legend.tickcolor
  character | Color of the ticks of the box in the legend.

legend.type
  character | Type of legend to display. One of:
    • normal: Default legend displayed by ggplot2.
    • colorbar: Redefined colorbar legend, using guide_colorbar.

legend.position
  character | Position of the legend in the plot. One of:
    • top: Top of the figure.
    • bottom: Bottom of the figure.
    • left: Left of the figure.
    • right: Right of the figure.
    • none: No legend is displayed.

legend.nrow
  numeric | Number of rows in the legend.

legend.ncol
  numeric | Number of columns in the legend.

legend.byrow
  logical | Whether the legend is filled by row or not.

number.breaks
  numeric | Controls the number of breaks in continuous color scales of ggplot2-based plots.

diverging.palette
  character | Type of symmetrical color palette to use. Out of the diverging palettes defined in brewer.pal.

```

diverging.direction	<code>numeric</code> Either 1 or -1. Direction of the diverging palette. This basically flips the two ends.
axis.text.x.angle	<code>numeric</code> Degree to rotate the X labels. One of: 0, 45, 90.
border.color	<code>character</code> Color for the border of the heatmap body.
return_object	<code>logical</code> Returns the Seurat object with the modifications performed in the function. Normally, this contains a new assay with the data that can then be used for any other visualization desired.
verbose	<code>logical</code> Whether to show extra comments, warnings,etc.
plot.title.face, axis.title.face	<code>character</code> Controls the style of the font for the corresponding theme element. One of: <ul style="list-style-type: none">• plain: For normal text.• italic: For text in italic.• bold: For text in bold.• bold.italic: For text both in italic and bold.
plot.subtitle.face, axis.text.face, legend.title.face, legend.text.face	

Value

A list of `ggplot2` objects, one per dimensional reduction component, and a `Seurat` object if desired.

Examples

```

p

} else if (base::isFALSE(value)){
  message("This function can not be used without its suggested packages.")
  message("Check out which ones are needed using `SCpubr::state_dependencies()`")
}

```

do_RidgePlot*Create ridge plots.***Description**

This function computes ridge plots based on the **ggridges** package.

Usage

```

do_RidgePlot(
  sample,
  feature,
  group.by = NULL,
  split.by = NULL,
  assay = "SCT",
  slot = "data",
  continuous_scale = FALSE,
  legend.title = NULL,
  legend.ncol = NULL,
  legend.nrow = NULL,
  legend.byrow = FALSE,
  legend.position = "bottom",
  legend.width = 1,
  legend.length = 20,
  legend.framewidth = 0.5,
  legend.tickwidth = 0.5,
  legend.framecolor = "grey50",
  legend.tickcolor = "white",
  legend.type = "colorbar",
  colors.use = NULL,
  colorblind = FALSE,
  font.size = 14,
  font.type = "sans",
  axis.text.x.angle = 45,
  plot.title = NULL,
  plot.subtitle = NULL,
  plot.caption = NULL,
  xlab = NULL,
  ylab = NULL,
)

```

```

use_viridis = FALSE,
viridis.palette = "G",
viridis.direction = 1,
sequential.palette = "YlGnBu",
sequential.direction = 1,
plot.grid = TRUE,
grid.color = "grey75",
grid.type = "dashed",
flip = FALSE,
number.breaks = 5,
plot.title.face = "bold",
plot.subtitle.face = "plain",
plot.caption.face = "italic",
axis.title.face = "bold",
axis.text.face = "plain",
legend.title.face = "bold",
legend.text.face = "plain"
)

```

Arguments

sample	<code>Seurat</code> A Seurat object, generated by CreateSeuratObject .
feature	<code>character</code> Feature to represent.
group.by	<code>character</code> Metadata variable to group the output by. Has to be a character or factor column.
split.by	<code>character</code> Secondary metadata variable to further group (split) the output by. Has to be a character of factor column.
assay	<code>character</code> Assay to use. Defaults to the current assay.
slot	<code>character</code> Data slot to use. Only one of: counts, data, scale.data. Defaults to "data".
continuous_scale	<code>logical</code> Whether to color the ridges depending on a categorical or continuous scale.
legend.title	<code>character</code> Title for the legend.
legend.ncol	<code>numeric</code> Number of columns in the legend.
legend.nrow	<code>numeric</code> Number of rows in the legend.
legend.byrow	<code>logical</code> Whether the legend is filled by row or not.
legend.position	<code>character</code> Position of the legend in the plot. One of: <ul style="list-style-type: none"> • top: Top of the figure. • bottom: Bottom of the figure. • left: Left of the figure. • right: Right of the figure. • none: No legend is displayed.

```

legend.length, legend.width
    numeric | Length and width of the legend. Will adjust automatically depending
    on legend side.

legend.framewidth, legend.tickwidth
    numeric | Width of the lines of the box in the legend.

legend.framecolor
    character | Color of the lines of the box in the legend.

legend.tickcolor
    character | Color of the ticks of the box in the legend.

legend.type      character | Type of legend to display. One of:
    • normal: Default legend displayed by ggplot2.
    • colorbar: Redefined colorbar legend, using guide_colorbar.

colors.use       character | Named vector of colors to use. Has to match the unique values of
                    group.by or color.by (if used) when scale_type is set to categorical.

colorblind        logical | Whether to use colorblind-friendly colors for categorical variables.
                    In place when colors.use is not used. Allows for a maximum of 85 different
                    classes within a categorical variable.

font.size        numeric | Overall font size of the plot. All plot elements will have a size relation-
                    ship with this font size.

font.type         character | Base font family for the plot. One of:
    • mono: Mono spaced font.
    • serif: Serif font family.
    • sans: Default font family.

axis.text.x.angle
    numeric | Degree to rotate the X labels. One of: 0, 45, 90.

plot.title, plot.subtitle, plot.caption
    character | Title, subtitle or caption to use in the plot.

xlab, ylab        character | Titles for the X and Y axis.

use_viridis       logical | Whether to use viridis color scales.

viridis.palette
    character | A capital letter from A to H or the scale name as in scale_fill_viridis.

viridis.direction
    numeric | Either 1 or -1. Controls how the gradient of viridis scale is formed.

sequential.palette
    character | Type of sequential color palette to use. Out of the sequential
    palettes defined in brewer.pal.

sequential.direction
    numeric | Direction of the sequential color scale. Either 1 or -1.

plot.grid          logical | Whether to plot grid lines.

grid.color         character | Color of the grid in the plot. In heatmaps, color of the border of the
                    cells.

grid.type          character | One of the possible linetype options:

```

- blank.
- solid.
- dashed.
- dotted.
- dotdash.
- longdash.
- twodash.

flip `logical` | Whether to invert the axis of the displayed plot.

number.breaks `numeric` | Controls the number of breaks in continuous color scales of ggplot2-based plots.

plot.title.face, **plot.subtitle.face**, **plot.caption.face**,
axis.title.face, **axis.text.face**, **legend.title.face**, **legend.text.face**

`character` | Controls the style of the font for the corresponding theme element.
One of:

- plain: For normal text.
- italic: For text in italic.
- bold: For text in bold.
- bold.italic: For text both in italic and bold.

Value

A ggplot2 object.

Examples

```
# Check Suggests.
value <- SCpubr:::check_suggests(function_name = "do_RidgePlot", passive = TRUE)

if (isTRUE(value)){
  # Consult the full documentation in https://enblacar.github.io/SCpubr-book/
  # Define your Seurat object.
  sample <- readRDS(system.file("extdata/seurat_dataset_example.rds", package = "SCpubr"))

  # Compute the most basic ridge plot.
  p <- SCpubr:::do_RidgePlot(sample = sample,
                               feature = "nFeature_RNA")
  p

  # Use continuous color scale.
  p <- SCpubr:::do_RidgePlot(sample = sample,
                               feature = "nFeature_RNA",
                               continuous_scale = TRUE,
                               viridis.direction = 1)
  p

} else if (base::isFALSE(value)){
  message("This function can not be used without its suggested packages.")
}
```

```
    message("Check out which ones are needed using `SCpubr::state_dependencies()`")
}
```

do_SCEnrichmentHeatmap

Perform a single-cell-based heatmap showing the enrichment in a list of gene sets.

Description

This function is heavily inspired by [DoHeatmap](#).

Usage

```
do_SCEnrichmentHeatmap(
  sample,
  input_gene_list,
  assay = NULL,
  slot = NULL,
  group.by = NULL,
  features.order = NULL,
  metadata = NULL,
  metadata.colors = NULL,
  colorblind = FALSE,
  subsample = NA,
  cluster = TRUE,
  flavor = "Seurat",
  return_object = FALSE,
  ncores = 1,
  storeRanks = TRUE,
  interpolate = FALSE,
  nbin = 24,
  ctrl = 100,
  xlab = "Cells",
  ylab = "Gene set",
  font.size = 14,
  font.type = "sans",
  plot.title = NULL,
  plot.subtitle = NULL,
  plot.caption = NULL,
  legend.position = "bottom",
  legend.title = NULL,
  legend.type = "colorbar",
  legend.framewidth = 0.5,
  legend.tickwidth = 0.5,
  legend.length = 20,
```

```

    legend.width = 1,
    legend.framecolor = "grey50",
    legend.tickcolor = "white",
    strip.text.color = "black",
    strip.text.angle = 0,
    strip.spacing = 10,
    legend.ncol = NULL,
    legend.nrow = NULL,
    legend.byrow = FALSE,
    min.cutoff = NA,
    max.cutoff = NA,
    number.breaks = 5,
    main.heatmap.size = 0.95,
    enforce_symmetry = FALSE,
    use_viridis = FALSE,
    viridis.palette = "G",
    viridis.direction = -1,
    na.value = "grey75",
    diverging.palette = "RdBu",
    diverging.direction = -1,
    sequential.palette = "YlGnBu",
    sequential.direction = 1,
    proportional.size = TRUE,
    verbose = FALSE,
    border.color = "black",
    plot.title.face = "bold",
    plot.subtitle.face = "plain",
    plot.caption.face = "italic",
    axis.title.face = "bold",
    axis.text.face = "plain",
    legend.title.face = "bold",
    legend.text.face = "plain"
)

```

Arguments

sample	<code>Seurat</code> A Seurat object, generated by CreateSeuratObject .
input_gene_list	<code>named_list</code> Named list of lists of genes to be used as input.
assay	<code>character</code> Assay to use. Defaults to the current assay.
slot	<code>character</code> Data slot to use. Only one of: counts, data, scale.data. Defaults to "data".
group.by	<code>character</code> Metadata variable to group the output by. Has to be a character or factor column.
features.order	<code>character</code> Should the gene sets be ordered in a specific way? Provide it as a vector of characters with the same names as the names of the gene sets.
metadata	<code>character</code> Categorical metadata variables to plot alongside the main heatmap.

```

metadata.colors
  named_list | Named list of valid colors for each of the variables defined in
  metadata.

colorblind
  logical | Whether to use colorblind-friendly colors for categorical variables.
  In place when colors.use is not used. Allows for a maximum of 85 different
  classes within a categorical variable.

subsample
  numeric | Number of cells to subset for the analysis. NA will use all. Cells are
  selected at random.

cluster
  logical | Whether to perform clustering of rows and columns.

flavor
  character | One of: Seurat, UCell. Compute the enrichment scores using Add-
  dModuleScore or AddModuleScore_UCell.

return_object
  logical | Returns the Seurat object with the modifications performed in the
  function. Normally, this contains a new assay with the data that can then be used
  for any other visualization desired.

ncores
  numeric | Number of cores used to run UCell scoring.

storeRanks
  logical | Whether to store the ranks for faster UCell scoring computations.
  Might require large amounts of RAM.

interpolate
  logical | Smoothes the output heatmap, saving space on disk when saving the
  image. However, the image is not as crisp.

nbin
  numeric | Number of bins to use in AddModuleScore.

ctrl
  numeric | Number of genes in the control set to use in AddModuleScore.

xlab, ylab
  character | Titles for the X and Y axis.

font.size
  numeric | Overall font size of the plot. All plot elements will have a size rela-
  tionship with this font size.

font.type
  character | Base font family for the plot. One of:
    • mono: Mono spaced font.
    • serif: Serif font family.
    • sans: Default font family.

plot.title, plot.subtitle, plot.caption
  character | Title, subtitle or caption to use in the plot.

legend.position
  character | Position of the legend in the plot. One of:
    • top: Top of the figure.
    • bottom: Bottom of the figure.
    • left: Left of the figure.
    • right: Right of the figure.
    • none: No legend is displayed.

legend.title
  character | Title for the legend.

legend.type
  character | Type of legend to display. One of:
    • normal: Default legend displayed by ggplot2.
    • colorbar: Redefined colorbar legend, using guide_colorbar.

```

```

legend.framewidth, legend.tickwidth
    numeric | Width of the lines of the box in the legend.
legend.length, legend.width
    numeric | Length and width of the legend. Will adjust automatically depending
    on legend side.
legend.framecolor
    character | Color of the lines of the box in the legend.
legend.tickcolor
    character | Color of the ticks of the box in the legend.
strip.text.color
    character | Color of the strip text.
strip.text.angle
    numeric | Rotation of the strip text (angles).
strip.spacing numeric | Controls the size between the different facets.
legend.ncol numeric | Number of columns in the legend.
legend.nrow numeric | Number of rows in the legend.
legend.byrow logical | Whether the legend is filled by row or not.
min.cutoff, max.cutoff
    numeric | Set the min/max ends of the color scale. Any cell/group with a value
    lower than min.cutoff will turn into min.cutoff and any cell with a value higher
    than max.cutoff will turn into max.cutoff. In FeaturePlots, provide as many
    values as features. Use NAs to skip a feature.
number.breaks numeric | Controls the number of breaks in continuous color scales of ggplot2-
    based plots.
main.heatmap.size
    numeric | Controls the size of the main heatmap (proportion-wise, defaults to
    0.95).
enforce_symmetry
    logical | Return a symmetrical plot axes-wise or continuous color scale-wise,
    when applicable.
use_viridis logical | Whether to use viridis color scales.
viridis.palette
    character | A capital letter from A to H or the scale name as in scale\_fill\_viridis.
viridis.direction
    numeric | Either 1 or -1. Controls how the gradient of viridis scale is formed.
na.value character | Color value for NA.
diverging.palette
    character | Type of symmetrical color palette to use. Out of the diverging
    palettes defined in brewer.pal.
diverging.direction
    numeric | Either 1 or -1. Direction of the diverging palette. This basically flips
    the two ends.
sequential.palette
    character | Type of sequential color palette to use. Out of the sequential
    palettes defined in brewer.pal.

```

```

sequential.direction
  numeric | Direction of the sequential color scale. Either 1 or -1.

proportional.size
  logical | Whether the groups should take the same space in the plot or not.

verbose
  logical | Whether to show extra comments, warnings,etc.

border.color
  character | Color for the border of the heatmap body.

plot.title.face, plot.subtitle.face, plot.caption.face,
axis.title.face, axis.text.face, legend.title.face, legend.text.face
  character | Controls the style of the font for the corresponding theme element.

One of:
  • plain: For normal text.
  • italic: For text in italic.
  • bold: For text in bold.
  • bold.italic: For text both in italic and bold.

```

Value

A ggplot2 object.

Examples

```

# Check Suggests.
value <- SCpubr:::check_suggests(function_name = "do_SCEnrichmentHeatmap", passive = TRUE)

if (isTRUE(value)){
  # Consult the full documentation in https://enblacar.github.io/SCpubr-book/
  # Define your Seurat object.
  sample <- readRDS(system.file("extdata/seurat_dataset_example.rds", package = "SCpubr"))

  # Genes have to be unique.
  genes <- list("A" = rownames(sample)[1:5],
                "B" = rownames(sample)[6:10],

proportional.size = TRUE,
verbose = TRUE,
border.color = "black",
plot.title.face = "bold",
plot.subtitle.face = "plain",
plot.caption.face = "italic",
axis.title.face = "bold",
axis.text.face = "plain",
legend.title.face = "bold",
legend.text.face = "plain"
)

```

Arguments

<code>sample</code>	<code>Seurat</code> A Seurat object, generated by CreateSeuratObject .
<code>features</code>	<code>character</code> Features to represent.
<code>assay</code>	<code>character</code> Assay to use. Defaults to the current assay.
<code>slot</code>	<code>character</code> Data slot to use. Only one of: counts, data, scale.data. Defaults to "data".
<code>group.by</code>	<code>character</code> Metadata variable to group the output by. Has to be a character or factor column.
<code>features.order</code>	<code>character</code> Should the gene sets be ordered in a specific way? Provide it as a vector of characters with the same names as the names of the gene sets.
<code>metadata</code>	<code>character</code> Categorical metadata variables to plot alongside the main heatmap.
<code>metadata.colors</code>	<code>named_list</code> Named list of valid colors for each of the variables defined in metadata.
<code>colorblind</code>	<code>logical</code> Whether to use colorblind-friendly colors for categorical variables. In place when <code>colors.use</code> is not used. Allows for a maximum of 85 different classes within a categorical variable.
<code>subsample</code>	<code>numeric</code> Number of cells to subset for the analysis. NA will use all. Cells are selected at random.
<code>cluster</code>	<code>logical</code> Whether to perform clustering of rows and columns.
<code>interpolate</code>	<code>logical</code> Smoothes the output heatmap, saving space on disk when saving the image. However, the image is not as crisp.

xlab, ylab	character Titles for the X and Y axis.
font.size	numeric Overall font size of the plot. All plot elements will have a size relationship with this font size.
font.type	character Base font family for the plot. One of: <ul style="list-style-type: none">• mono: Mono spaced font.• serif: Serif font family.• sans: Default font family.
plot.title, plot.subtitle, plot.caption	character Title, subtitle or caption to use in the plot.
legend.position	character Position of the legend in the plot. One of: <ul style="list-style-type: none">• top: Top of the figure.• bottom: Bottom of the figure.• left: Left of the figure.• right: Right of the figure.• none: No legend is displayed.
legend.title	character Title for the legend.
legend.type	character Type of legend to display. One of: <ul style="list-style-type: none">• normal: Default legend displayed by ggplot2.• colorbar: Redefined colorbar legend, using guide_colorbar.
legend.framewidth, legend.tickwidth	numeric Width of the lines of the box in the legend.
legend.length, legend.width	numeric Length and width of the legend. Will adjust automatically depending on legend side.
legend.framecolor	character Color of the lines of the box in the legend.
legend.tickcolor	character Color of the ticks of the box in the legend.
strip.text.color	character Color of the strip text.
strip.text.angle	numeric Rotation of the strip text (angles).
strip.spacing	numeric Controls the size between the different facets.
legend.ncol	numeric Number of columns in the legend.
legend.nrow	numeric Number of rows in the legend.
legend.byrow	logical Whether the legend is filled by row or not.
min.cutoff, max.cutoff	numeric Set the min/max ends of the color scale. Any cell/group with a value lower than min.cutoff will turn into min.cutoff and any cell with a value higher than max.cutoff will turn into max.cutoff. In FeaturePlots, provide as many values as features. Use NAs to skip a feature.

number.breaks **numeric** | Controls the number of breaks in continuous color scales of ggplot2-based plots.

main.heatmap.size
 numeric | Controls the size of the main heatmap (proportion-wise, defaults to 0.95).

enforce_symmetry
 logical | Return a symmetrical plot axes-wise or continuous color scale-wise, when applicable.

use_viridis **logical** | Whether to use viridis color scales.

viridis.palette
 character | A capital letter from A to H or the scale name as in `scale_fill_viridis`.

viridis.direction
 numeric | Either 1 or -1. Controls how the gradient of viridis scale is formed.

na.value **character** | Color value for NA.

diverging.palette
 character | Type of symmetrical color palette to use. Out of the diverging palettes defined in `brewer.pal`.

diverging.direction
 numeric | Either 1 or -1. Direction of the diverging palette. This basically flips the two ends.

sequential.palette
 character | Type of sequential color palette to use. Out of the sequential palettes defined in `brewer.pal`.

sequential.direction
 numeric | Direction of the sequential color scale. Either 1 or -1.

proportional.size
 logical | Whether the groups should take the same space in the plot or not.

verbose **logical** | Whether to show extra comments, warnings,etc.

border.color **character** | Color for the border of the heatmap body.

plot.title.face, **plot.subtitle.face**, **plot.caption.face**,
axis.title.face, **axis.text.face**, **legend.title.face**, **legend.text.face**
 character | Controls the style of the font for the corresponding theme element.
 One of:

- plain: For normal text.
- italic: For text in italic.
- bold: For text in bold.
- bold.italic: For text both in italic and bold.

Value

A ggplot2 object.

Examples

```
# Check Suggests.
value <- SCpubr:::check_suggests(function_name = "do_SCExpressionHeatmap", passive = TRUE)

if (isTRUE(value)){
  # Consult the full documentation in https://enblacar.github.io/SCpubr-book/
  # Define your Seurat object.
  sample <- readRDS(system.file("extdata/seurat_dataset_example.rds", package = "SCpubr"))

  p <- SCpubr::do_SCExpressionHeatmap(sample = sample,
                                         features = rownames(sample)[1:2],
                                         subsample = NA)
  p

} else if (base::isFALSE(value)){
  message("This function can not be used without its suggested packages.")
  message("Check out which ones are needed using `SCpubr::state_dependencies()`")
}
```

do_StripPlot

Generate a Strip plot.

Description

A strip plot is a scatter plot in which we plot continuous values on the Y axis grouped by a categorical value in the X. This is plotted as a dot plot, jittered so that the dots span all the way to the other groups. On top of this, the mean and .66 and .95 of the data is plotted, depicting the overall distribution of the dots. The cells can, then, be colored by a continuous variable (same as Y axis or different) or a categorical one (same as X axis or different).

Usage

```
do_StripPlot(
  sample,
  features,
  assay = NULL,
  slot = "data",
  group.by = NULL,
  split.by = NULL,
  enforce_symmetry = FALSE,
  scale_type = "continuous",
  order = TRUE,
  plot_cell_borders = TRUE,
  jitter = 0.45,
  pt.size = 1,
  border.size = 2,
```

```

border.color = "black",
legend.position = "bottom",
legend.width = 1,
legend.length = 20,
legend.framewidth = 0.5,
legend.tickwidth = 0.5,
legend.framecolor = "grey50",
legend.tickcolor = "white",
legend.type = "colorbar",
font.size = 14,
font.type = "sans",
axis.text.x.angle = 45,
viridis.palette = "G",
viridis.direction = 1,
colors.use = NULL,
colorblind = FALSE,
na.value = "grey75",
legend.ncol = NULL,
legend.nrow = NULL,
legend.icon.size = 4,
legend.byrow = FALSE,
legend.title = NULL,
plot.title = NULL,
plot.subtitle = NULL,
plot.caption = NULL,
xlab = "Groups",
ylab = feature,
flip = FALSE,
min.cutoff = rep(NA, length(features)),
max.cutoff = rep(NA, length(features)),
number.breaks = 5,
diverging.palette = "RdBu",
diverging.direction = -1,
sequential.palette = "YlGnBu",
sequential.direction = 1,
use_viridis = FALSE,
plot.title.face = "bold",
plot.subtitle.face = "plain",
plot.caption.face = "italic",
axis.title.face = "bold",
axis.text.face = "plain",
legend.title.face = "bold",
legend.text.face = "plain"
)

```

Arguments

sample [Seurat](#) | A Seurat object, generated by [CreateSeuratObject](#).

features	<code>character</code> Features to represent.
assay	<code>character</code> Assay to use. Defaults to the current assay.
slot	<code>character</code> Data slot to use. Only one of: counts, data, scale.data. Defaults to "data".
group.by	<code>character</code> Metadata variable to group the output by. Has to be a character or factor column.
split.by	<code>character</code> Secondary metadata variable to further group (split) the output by. Has to be a character of factor column.
enforce_symmetry	<code>logical</code> Return a symmetrical plot axes-wise or continuous color scale-wise, when applicable.
scale_type	<code>character</code> Type of color scale to use. One of: <ul style="list-style-type: none"> • <code>categorical</code>: Use a categorical color scale based on the values of "group.by". • <code>continuous</code>: Use a continuous color scale based on the values of "feature".
order	<code>logical</code> Whether to order the groups by the median of the data (highest to lowest).
plot_cell_borders	<code>logical</code> Whether to plot border around cells.
jitter	<code>numeric</code> Amount of jitter in the plot along the X axis. The lower the value, the more compacted the dots are.
pt.size	<code>numeric</code> Size of the dots.
border.size	<code>numeric</code> Width of the border of the cells.
border.color	<code>character</code> Color for the border of the heatmap body.
legend.position	<code>character</code> Position of the legend in the plot. One of: <ul style="list-style-type: none"> • <code>top</code>: Top of the figure. • <code>bottom</code>: Bottom of the figure. • <code>left</code>: Left of the figure. • <code>right</code>: Right of the figure. • <code>none</code>: No legend is displayed.
legend.length, legend.width	<code>numeric</code> Length and width of the legend. Will adjust automatically depending on legend side.
legend.framewidth, legend.tickwidth	<code>numeric</code> Width of the lines of the box in the legend.
legend.framecolor	<code>character</code> Color of the lines of the box in the legend.
legend.tickcolor	<code>character</code> Color of the ticks of the box in the legend.
legend.type	<code>character</code> Type of legend to display. One of: <ul style="list-style-type: none"> • <code>normal</code>: Default legend displayed by <code>ggplot2</code>. • <code>colorbar</code>: Redefined colorbar legend, using <code>guide_colorbar</code>.

<code>font.size</code>	<code>numeric</code> Overall font size of the plot. All plot elements will have a size relationship with this font size.
<code>font.type</code>	<code>character</code> Base font family for the plot. One of: <ul style="list-style-type: none">• <code>mono</code>: Mono spaced font.• <code>serif</code>: Serif font family.• <code>sans</code>: Default font family.
<code>axis.text.x.angle</code>	<code>numeric</code> Degree to rotate the X labels. One of: 0, 45, 90.
<code>viridis.palette</code>	<code>character</code> A capital letter from A to H or the scale name as in <code>scale_fill_viridis</code> .
<code>viridis.direction</code>	<code>numeric</code> Either 1 or -1. Controls how the gradient of viridis scale is formed.
<code>colors.use</code>	<code>character</code> Named vector of colors to use. Has to match the unique values of <code>group_by</code> when <code>scale_type</code> is set to categorical.
<code>colorblind</code>	<code>logical</code> Whether to use colorblind-friendly colors for categorical variables. In place when <code>colors.use</code> is not used. Allows for a maximum of 85 different classes within a categorical variable.
<code>na.value</code>	<code>character</code> Color value for NA.
<code>legend.ncol</code>	<code>numeric</code> Number of columns in the legend.
<code>legend.nrow</code>	<code>numeric</code> Number of rows in the legend.
<code>legend.icon.size</code>	<code>numeric</code> Size of the icons in legend.
<code>legend.byrow</code>	<code>logical</code> Whether the legend is filled by row or not.
<code>legend.title</code>	<code>character</code> Title for the legend.
<code>plot.title, plot.subtitle, plot.caption</code>	<code>character</code> Title, subtitle or caption to use in the plot.
<code>xlab, ylab</code>	<code>character</code> Titles for the X and Y axis.
<code>flip</code>	<code>logical</code> Whether to invert the axis of the displayed plot.
<code>min.cutoff, max.cutoff</code>	<code>numeric</code> Set the min/max ends of the color scale. Any cell/group with a value lower than <code>min.cutoff</code> will turn into <code>min.cutoff</code> and any cell with a value higher than <code>max.cutoff</code> will turn into <code>max.cutoff</code> . In FeaturePlots, provide as many values as features. Use NAs to skip a feature.
<code>number.breaks</code>	<code>numeric</code> Controls the number of breaks in continuous color scales of ggplot2-based plots.
<code>diverging.palette</code>	<code>character</code> Type of symmetrical color palette to use. Out of the diverging palettes defined in <code>brewer.pal</code> .
<code>diverging.direction</code>	<code>numeric</code> Either 1 or -1. Direction of the diverging palette. This basically flips the two ends.
<code>sequential.palette</code>	<code>character</code> Type of sequential color palette to use. Out of the sequential palettes defined in <code>brewer.pal</code> .

```

sequential.direction
  numeric | Direction of the sequential color scale. Either 1 or -1.

use_viridis    logical | Whether to use viridis color scales.

plot.title.face,      plot.subtitle.face,      plot.caption.face,
axis.title.face, axis.text.face, legend.title.face, legend.text.face
  character | Controls the style of the font for the corresponding theme element.
  One of:
    • plain: For normal text.
    • italic: For text in italic.
    • bold: For text in bold.
    • bold.italic: For text both in italic and bold.

```

Value

Either a plot of a list of plots, depending on the number of features provided.

Examples

```

# Check Suggests.
value <- SCpubr:::check_suggests(function_name = "do_StripPlot", passive = TRUE)

if (isTRUE(value)){
  # Consult the full documentation in https://enblacar.github.io/SCpubr-book/

  # Define your Seurat object.
  sample <- readRDS(system.file("extdata/seurat_dataset_example.rds", package = "SCpubr"))

  # Geyser plot with categorical color scale.
  p <- SCpubr::do_StripPlot(sample = sample,
                            features = "nCount_RNA",
                            scale_type = "categorical")
  p

  # Geyser plot with continuous color scale.
  p <- SCpubr::do_StripPlot(sample = sample,
                            features = "nCount_RNA",
                            scale_type = "continuous")

  p

} else if (base::isFALSE(value)){
  message("This function can not be used without its suggested packages.")
  message("Check out which ones are needed using `SCpubr::state_dependencies()`.")
}

```

do_TermEnrichmentPlot *Display the enriched terms for a given list of genes.*

Description

Display the enriched terms for a given list of genes.

Usage

```
do_TermEnrichmentPlot(  
  mat,  
  n.chars = 40,  
  n.terms = 25,  
  font.size = 14,  
  font.type = "sans",  
  plot.title = NULL,  
  plot.subtitle = NULL,  
  plot.caption = NULL,  
  use_viridis = FALSE,  
  viridis.palette = "G",  
  viridis.direction = -1,  
  sequential.palette = "YlGnBu",  
  sequential.direction = 1,  
  dot.scale = 8,  
  legend.type = "colorbar",  
  legend.position = "bottom",  
  legend.framewidth = 0.5,  
  legend.tickwidth = 0.5,  
  legend.length = 20,  
  legend.width = 1,  
  legend.framecolor = "grey50",  
  legend.tickcolor = "white",  
  number.breaks = 5,  
  xlab = NULL,  
  ylab = NULL,  
  na.value = "grey75",  
  grid.color = "grey90",  
  grid.type = "dashed",  
  plot.title.face = "bold",  
  plot.subtitle.face = "plain",  
  plot.caption.face = "italic",  
  axis.title.face = "bold",  
  axis.text.face = "plain",  
  axis.text.x.angle = 45,  
  legend.title.face = "bold",  
  legend.text.face = "plain"  
)
```

Arguments

<code>mat</code>	<code>list</code> Result of over-representation test with clusterProfiler. Accepts only one result, be aware of that if you compute the test for all GO ontologies. Accessed through <code>mat\$result</code> .
<code>n.chars</code>	<code>numeric</code> Number of characters to use as a limit to wrap the term names. The higher this value, the longer the lines would be for each term in the plots. Defaults to 40.
<code>n.terms</code>	<code>numeric</code> Number of terms to display. Defaults to 25.
<code>font.size</code>	<code>numeric</code> Overall font size of the plot. All plot elements will have a size relationship with this font size.
<code>font.type</code>	<code>character</code> Base font family for the plot. One of: <ul style="list-style-type: none"> • <code>mono</code>: Mono spaced font. • <code>serif</code>: Serif font family. • <code>sans</code>: Default font family.
<code>plot.title, plot.subtitle, plot.caption</code>	<code>character</code> Title, subtitle or caption to use in the plot.
<code>use_viridis</code>	<code>logical</code> Whether to use viridis color scales.
<code>viridis.palette</code>	<code>character</code> A capital letter from A to H or the scale name as in <code>scale_fill_viridis</code> .
<code>viridis.direction</code>	<code>numeric</code> Either 1 or -1. Controls how the gradient of viridis scale is formed.
<code>sequential.palette</code>	<code>character</code> Type of sequential color palette to use. Out of the sequential palettes defined in <code>brewer.pal</code> .
<code>sequential.direction</code>	<code>numeric</code> Direction of the sequential color scale. Either 1 or -1.
<code>dot.scale</code>	<code>numeric</code> Scale the size of the dots.
<code>legend.type</code>	<code>character</code> Type of legend to display. One of: <ul style="list-style-type: none"> • <code>normal</code>: Default legend displayed by <code>ggplot2</code>. • <code>colorbar</code>: Redefined colorbar legend, using <code>guide_colorbar</code>.
<code>legend.position</code>	<code>character</code> Position of the legend in the plot. One of: <ul style="list-style-type: none"> • <code>top</code>: Top of the figure. • <code>bottom</code>: Bottom of the figure. • <code>left</code>: Left of the figure. • <code>right</code>: Right of the figure. • <code>none</code>: No legend is displayed.
<code>legend.framewidth, legend.tickwidth</code>	<code>numeric</code> Width of the lines of the box in the legend.
<code>legend.length, legend.width</code>	<code>numeric</code> Length and width of the legend. Will adjust automatically depending on legend side.

```

legend.framecolor
  character | Color of the lines of the box in the legend.
legend.tickcolor
  character | Color of the ticks of the box in the legend.
number.breaks numeric | Controls the number of breaks in continuous color scales of ggplot2-based plots.
xlab, ylab    character | Titles for the X and Y axis.
na.value      character | Color value for NA.
grid.color    character | Color of the grid in the plot. In heatmaps, color of the border of the cells.
grid.type     character | One of the possible linetype options:
  • blank.
  • solid.
  • dashed.
  • dotted.
  • dotdash.
  • longdash.
  • twodash.
plot.title.face,      plot.subtitle.face,      plot.caption.face,
axis.title.face, axis.text.face, legend.title.face, legend.text.face
  character | Controls the style of the font for the corresponding theme element.
One of:
  • plain: For normal text.
  • italic: For text in italic.
  • bold: For text in bold.
  • bold.italic: For text both in italic and bold.
axis.text.x.angle
  numeric | Degree to rotate the X labels. One of: 0, 45, 90.

```

Value

A dotplot object with enriched terms.

Examples

```

# Check Suggests.
value <- SCpubr:::check_suggests(function_name = "do_TermEnrichmentPlot", passive = TRUE)

if (isTRUE(value)){
  # Consult the full documentation in https://enblacar.github.io/SCpubr-book/
  # Define your enriched terms.
  enriched_terms <- readRDS(system.file("extdata/enriched_terms_example.rds", package = "SCpubr"))

  # Default plot.
  p <- SCpubr::do_TermEnrichmentPlot(mat = enriched_terms)
}

```

```
} else if (base::isFALSE(value)){
  message("This function can not be used without its suggested packages.")
  message("Check out which ones are needed using `SCpubr::state_dependencies()`")
}
```

do_TFActivityHeatmap *Plot TF Activities from decoupleR using Dorothea prior knowledge.*

Description

Plot TF Activities from decoupleR using Dorothea prior knowledge.

Usage

```
do_TFActivityHeatmap(
  sample,
  activities,
  n_tfs = 25,
  slot = "scale.data",
  statistic = "norm_wmean",
  tfs.use = NULL,
  group.by = NULL,
  split.by = NULL,
  values.show = FALSE,
  values.threshold = NULL,
  values.size = 3,
  values.round = 1,
  na.value = "grey75",
  legend.position = "bottom",
  legend.width = 1,
  legend.length = 20,
  legend.framewidth = 0.5,
  legend.tickwidth = 0.5,
  legend.framecolor = "grey50",
  legend.tickcolor = "white",
  legend.type = "colorbar",
  font.size = 14,
  font.type = "sans",
  axis.text.x.angle = 45,
  enforce_symmetry = TRUE,
  diverging.palette = "RdBu",
  diverging.direction = -1,
  use_viridis = FALSE,
  viridis.palette = "G",
  viridis.direction = -1,
```

```

sequential.palette = "YlGnBu",
sequential.direction = 1,
min.cutoff = NA,
max.cutoff = NA,
number.breaks = 5,
flip = FALSE,
return_object = FALSE,
grid.color = "white",
border.color = "black",
plot.title.face = "bold",
plot.subtitle.face = "plain",
plot.caption.face = "italic",
axis.title.face = "bold",
axis.text.face = "plain",
legend.title.face = "bold",
legend.text.face = "plain"
)

```

Arguments

sample	<code>Seurat</code> A Seurat object, generated by CreateSeuratObject .
activities	<code>tibble</code> Result of running decoupleR method with dorothea regulon prior knowledge.
n_tfs	<code>numeric</code> Number of top regulons to consider for downstream analysis.
slot	<code>character</code> Data slot to use. Only one of: counts, data, scale.data. Defaults to "data".
statistic	<code>character</code> DecoupleR statistic to use. One of: <ul style="list-style-type: none"> • <code>wmean</code>: For weighted mean. • <code>norm_wmean</code>: For normalized weighted mean. • <code>corr_wmean</code>: For corrected weighted mean.
tfs.use	<code>character</code> Restrict the analysis to given regulons.
group.by	<code>character</code> Metadata variable to group the output by. Has to be a character of factor column.
split.by	<code>character</code> Secondary metadata variable to further group (split) the output by. Has to be a character of factor column.
values.show	<code>logical</code> Whether to add values as text in the heatmap.
values.threshold	<code>numeric</code> Value from which the text color turns from black to white. If mode = "hvg", this is applied to both ends of the color scale.
values.size	<code>numeric</code> Size of the text labels.
values.round	<code>numeric</code> Decimal to which round the values to.
na.value	<code>character</code> Color value for NA.
legend.position	<code>character</code> Position of the legend in the plot. One of:

- **top**: Top of the figure.
- **bottom**: Bottom of the figure.
- **left**: Left of the figure.
- **right**: Right of the figure.
- **none**: No legend is displayed.

legend.length, legend.width
`numeric` | Length and width of the legend. Will adjust automatically depending on legend side.

legend.framewidth, legend.tickwidth
`numeric` | Width of the lines of the box in the legend.

legend.framecolor
`character` | Color of the lines of the box in the legend.

legend.tickcolor
`character` | Color of the ticks of the box in the legend.

legend.type
`character` | Type of legend to display. One of:

- **normal**: Default legend displayed by **ggplot2**.
- **colorbar**: Redefined colorbar legend, using `guide_colorbar`.

font.size
`numeric` | Overall font size of the plot. All plot elements will have a size relationship with this font size.

font.type
`character` | Base font family for the plot. One of:

- **mono**: Mono spaced font.
- **serif**: Serif font family.
- **sans**: Default font family.

axis.text.x.angle
`numeric` | Degree to rotate the X labels. One of: 0, 45, 90.

enforce_symmetry
`logical` | Whether the geyser and feature plot has a symmetrical color scale.

diverging.palette
`character` | Type of symmetrical color palette to use. Out of the diverging palettes defined in `brewer.pal`.

diverging.direction
`numeric` | Either 1 or -1. Direction of the diverging palette. This basically flips the two ends.

use_viridis
`logical` | Whether to use viridis color scales.

viridis.palette
`character` | A capital letter from A to H or the scale name as in `scale_fill_viridis`.

viridis.direction
`numeric` | Either 1 or -1. Controls how the gradient of viridis scale is formed.

sequential.palette
`character` | Type of sequential color palette to use. Out of the sequential palettes defined in `brewer.pal`.

sequential.direction
`numeric` | Direction of the sequential color scale. Either 1 or -1.

```

min.cutoff, max.cutoff
  numeric | Set the min/max ends of the color scale. Any cell/group with a value
  lower than min.cutoff will turn into min.cutoff and any cell with a value higher
  than max.cutoff will turn into max.cutoff. In FeaturePlots, provide as many
  values as features. Use NAs to skip a feature.

number.breaks numeric | Controls the number of breaks in continuous color scales of ggplot2-
based plots.

flip logical | Whether to invert the axis of the displayed plot.

return_object logical | Returns the Seurat object with the modifications performed in the
function. Normally, this contains a new assay with the data that can then be used
for any other visualization desired.

grid.color character | Color of the grid in the plot. In heatmaps, color of the border of the
cells.

border.color character | Color for the border of the heatmap body.

plot.title.face, plot.subtitle.face, plot.caption.face,
axis.title.face, axis.text.face, legend.title.face, legend.text.face
  character | Controls the style of the font for the corresponding theme element.
One of:
  • plain: For normal text.
  • italic: For text in italic.
  • bold: For text in bold.
  • bold.italic: For text both in italic and bold.

```

Value

A ggplot2 object.

Examples

```

# Check Suggests.
value <- SCpubr:::check_suggests(function_name = "do_TFActivityHeatmap", passive = TRUE)

if (isTRUE(value)){
  # Consult the full documentation in https://enblacar.github.io/SCpubr-book/
  # Define your Seurat object.

  # General heatmap.
  out <- SCpubr:::do_TFActivityHeatmap(sample = sample,
                                         activities = dorothea_activities)
  p <- out$heatmaps$average_scores
  p

```

```
} else if (base::isFALSE(value)){
  message("This function can not be used without its suggested packages.")
  message("Check out which ones are needed using `SCpubr::state_dependencies()`")
}
```

do_ViolinPlot

Wrapper for [VlnPlot](#).

Description

Wrapper for [VlnPlot](#).

Usage

```
do_ViolinPlot(
  sample,
  features,
  assay = NULL,
  slot = NULL,
  group.by = NULL,
  split.by = NULL,
  colors.use = NULL,
  colorblind = FALSE,
  pt.size = 0,
  line_width = 0.5,
  y_cut = rep(NA, length(features)),
  plot_boxplot = TRUE,
  boxplot_width = 0.2,
  legend.position = "bottom",
  plot.title = NULL,
  plot.subtitle = NULL,
  plot.caption = NULL,
  xlab = rep(NA, length(features)),
  ylab = rep(NA, length(features)),
  font.size = 14,
  font.type = "sans",
  axis.text.x.angle = 45,
  plot.grid = TRUE,
  grid.color = "grey75",
  grid.type = "dashed",
  order = TRUE,
  flip = FALSE,
  ncol = NULL,
  share.y.lims = FALSE,
  legend.title = NULL,
```

```

    legend.title.position = "top",
    legend.ncol = NULL,
    legend.nrow = NULL,
    legend.byrow = FALSE,
    plot.title.face = "bold",
    plot.subtitle.face = "plain",
    plot.caption.face = "italic",
    axis.title.face = "bold",
    axis.text.face = "plain",
    legend.title.face = "bold",
    legend.text.face = "plain"
)

```

Arguments

sample	Seurat A Seurat object, generated by CreateSeuratObject .
features	character Features to represent.
assay	character Assay to use. Defaults to the current assay.
slot	character Data slot to use. Only one of: counts, data, scale.data. Defaults to "data".
group.by	character Metadata variable to group the output by. Has to be a character or factor column.
split.by	character Secondary metadata variable to further group (split) the output by. Has to be a character of factor column.
colors.use	named_vector Named vector of valid color representations (either name of HEX codes) with as many named colors as unique values of group.by. If group.by is not provided, defaults to the unique values of Idents . If not provided, a color scale will be set by default.
colorblind	logical Whether to use colorblind-friendly colors for categorical variables. In place when colors.use is not used. Allows for a maximum of 85 different classes within a categorical variable.
pt.size	numeric Size of points in the Violin plot.
line_width	numeric Width of the lines drawn in the plot. Defaults to 1.
y_cut	numeric Vector with the values in which the Violins should be cut. Only works for one feature.
plot_boxplot	logical Whether to plot a Box plot inside the violin or not.
boxplot_width	numeric Width of the boxplots. Defaults to 0.2.
legend.position	character Position of the legend in the plot. One of: <ul style="list-style-type: none"> • top: Top of the figure. • bottom: Bottom of the figure. • left: Left of the figure. • right: Right of the figure. • none: No legend is displayed.

```
plot.title, plot.subtitle, plot.caption
  character | Title, subtitle or caption to use in the plot.
xlab, ylab
  character | Titles for the X and Y axis.
font.size
  numeric | Overall font size of the plot. All plot elements will have a size relationship with this font size.
font.type
  character | Base font family for the plot. One of:
    • mono: Mono spaced font.
    • serif: Serif font family.
    • sans: Default font family.
axis.text.x.angle
  numeric | Degree to rotate the X labels. One of: 0, 45, 90.
plot.grid
  logical | Whether to plot grid lines.
grid.color
  character | Color of the grid in the plot. In heatmaps, color of the border of the cells.
grid.type
  character | One of the possible linetype options:
    • blank.
    • solid.
    • dashed.
    • dotted.
    • dotdash.
    • longdash.
    • twodash.
order
  logical | Whether to order the boxplots by average values. Can not be used alongside split.by.
flip
  logical | Whether to invert the axis of the displayed plot.
ncol
  numeric | Number of columns used in the arrangement of the output plot using "split.by" parameter.
share.y.lims
  logical | When querying multiple features, force the Y axis of all of them to be on the same range of values (this being the max and min of all features combined).
legend.title
  character | Title for the legend.
legend.title.position
  character | Position for the title of the legend. One of:
    • top: Top of the legend.
    • bottom: Bottom of the legend.
    • left: Left of the legend.
    • right: Right of the legend.
legend.ncol
  numeric | Number of columns in the legend.
legend.nrow
  numeric | Number of rows in the legend.
legend.byrow
  logical | Whether the legend is filled by row or not.
```

```
plot.title.face,      plot.subtitle.face,      plot.caption.face,
axis.title.face, axis.text.face, legend.title.face, legend.text.face
  character | Controls the style of the font for the corresponding theme element.
  One of:
    • plain: For normal text.
    • italic: For text in italic.
    • bold: For text in bold.
    • bold.italic: For text both in italic and bold.
```

Value

A ggplot2 object containing a Violin Plot.

Examples

```
# Check Suggests.

do_VolcanoPlot

Compute a Volcano plot out of DE genes.

Description

Compute a Volcano plot out of DE genes.

Usage

```
do_VolcanoPlot(  
  sample,  
  de_genes,  
  pval_cutoff = 0.05,  
  FC_cutoff = 2,  
  pt.size = 1,  
  border.size = 1.5,  
  border.color = "black",  
  font.size = 14,  
  font.type = "sans",  
  plot.title = NULL,  
  plot.subtitle = NULL,  
  plot.caption = NULL,  
  plot_lines = TRUE,  
  line_color = "grey75",  
  line_size = 0.5,  
  add_gene_tags = TRUE,  
  add_tag_side = "both",  
  order_tags_by = "both",  
  tag_size = 6,  
  n_genes = 5,  
  use_labels = FALSE,  
  colors.use = NULL,  
  plot.title.face = "bold",  
  plot.subtitle.face = "plain",  
  plot.caption.face = "italic",  
  axis.title.face = "bold",  
  axis.text.face = "plain",  
  legend.title.face = "bold",  
  legend.text.face = "plain"  
)
```

Arguments

sample	Seurat A Seurat object, generated by CreateSeuratObject .
de_genes	tibble Output of Seurat::FindMarkers() .
pval_cutoff	numeric Cutoff for the p-value.
FC_cutoff	numeric Cutoff for the avg_log2FC.
pt.size	numeric Size of the dots.
border.size	numeric Width of the border of the cells.
border.color	character Color for the border of the heatmap body.
font.size	numeric Overall font size of the plot. All plot elements will have a size relationship with this font size.
font.type	character Base font family for the plot. One of: <ul style="list-style-type: none">• mono: Mono spaced font.

- **serif**: Serif font family.
- **sans**: Default font family.

plot.title, plot.subtitle, plot.caption
character | Title, subtitle or caption to use in the plot.

plot_lines **logical** | Whether to plot the division lines.

line_color **character** | Color for the lines.

line_size **numeric** | Size of the lines in the plot.

add_gene_tags **logical** | Whether to plot the top genes.

add_tag_side **logical** | Either "both", "positive" or "negative" to indicate which side of genes to tag

order_tags_by **character** | Either "both", "pvalue" or "logfc".

tag_size **numeric** | Size of the text/label for the tags.

n_genes **numeric** | Number of top genes to plot.

use_labels **logical** | Whether to use labels instead of text for the tags.

colors.use **character** | Color to generate a tetradic color scale with. If NULL, default colors are used.

plot.title.face, plot.subtitle.face, plot.caption.face,
axis.title.face, axis.text.face, legend.title.face, legend.text.face
character | Controls the style of the font for the corresponding theme element.
One of:

- **plain**: For normal text.
- **italic**: For text in italic.
- **bold**: For text in bold.
- **bold.italic**: For text both in italic and bold.

Value

A volcano plot as a ggplot2 object.

Examples

```
# Check Suggests.
value <- SCpubr:::check_suggests(function_name = "do_VolcanoPlot", passive = TRUE)

if (isTRUE(value)){
  # Consult the full documentation in https://enblacar.github.io/SCpubr-book/

  # Define your Seurat object.
  sample <- readRDS(system.file("extdata/seurat_dataset_example.rds", package = "SCpubr"))

  # Retrieve DE genes.
  de_genes <- readRDS(system.file("extdata/de_genes_example.rds", package = "SCpubr"))

  # Generate a volcano plot.
  p <- SCpubr::do_VolcanoPlot(sample = sample,
                                de_genes = de_genes)
```

```
p  
}  
else if (base::isFALSE(value)){  
  message("This function can not be used without its suggested packages.")  
  message("Check out which ones are needed using `SCpubr::state_dependencies()`")  
}  
}
```

do_WafflePlot

Display the enriched terms for a given list of genes.

Description

Display the enriched terms for a given list of genes.

Usage

```
do_WafflePlot(  
  sample,  
  group.by,  
  waffle.size = 2,  
  flip = TRUE,  
  colors.use = NULL,  
  colorblind = FALSE,  
  na.value = "grey75",  
  font.size = 14,  
  font.type = "sans",  
  plot.title = NULL,  
  plot.subtitle = NULL,  
  plot.caption = NULL,  
  legend.title = NULL,  
  legend.ncol = NULL,  
  legend.nrow = NULL,  
  legend.byrow = FALSE,  
  legend.position = "bottom",  
  plot.title.face = "bold",  
  plot.subtitle.face = "plain",  
  plot.caption.face = "italic",  
  axis.title.face = "bold",  
  axis.text.face = "plain",  
  legend.title.face = "bold",  
  legend.text.face = "plain",  
  strip.text.face = "bold"  
)
```

Arguments

sample	<code>Seurat</code> A Seurat object, generated by CreateSeuratObject .
group.by	<code>character</code> Metadata variable to group the output by. Has to be a character or factor column.
waffle.size	<code>numeric</code> Tile border size.
flip	<code>logical</code> Whether to invert the axis of the displayed plot.
colors.use	<code>named_vector</code> Named vector of valid color representations (either name of HEX codes) with as many named colors as unique values of group.by. If group.by is not provided, defaults to the unique values of Idents . If not provided, a color scale will be set by default.
colorblind	<code>logical</code> Whether to use colorblind-friendly colors for categorical variables. In place when colors.use is not used. Allows for a maximum of 85 different classes within a categorical variable.
na.value	<code>character</code> Color value for NA.
font.size	<code>numeric</code> Overall font size of the plot. All plot elements will have a size relationship with this font size.
font.type	<code>character</code> Base font family for the plot. One of: <ul style="list-style-type: none"> • <code>mono</code>: Mono spaced font. • <code>serif</code>: Serif font family. • <code>sans</code>: Default font family.
plot.title, plot.subtitle, plot.caption	<code>character</code> Title, subtitle or caption to use in the plot.
legend.title	<code>character</code> Title for the legend.
legend.ncol	<code>numeric</code> Number of columns in the legend.
legend.nrow	<code>numeric</code> Number of rows in the legend.
legend.byrow	<code>logical</code> Whether the legend is filled by row or not.
legend.position	<code>character</code> Position of the legend in the plot. One of: <ul style="list-style-type: none"> • <code>top</code>: Top of the figure. • <code>bottom</code>: Bottom of the figure. • <code>left</code>: Left of the figure. • <code>right</code>: Right of the figure. • <code>none</code>: No legend is displayed.
plot.title.face, plot.subtitle.face, plot.caption.face, axis.title.face, axis.text.face, legend.title.face, legend.text.face	<code>character</code> Controls the style of the font for the corresponding theme element. One of: <ul style="list-style-type: none"> • <code>plain</code>: For normal text. • <code>italic</code>: For text in italic. • <code>bold</code>: For text in bold. • <code>bold.italic</code>: For text both in italic and bold.

`strip.text.face`

`character` | Controls the style of the font for the strip text. One of:

- `plain`: For normal text.
- `italic`: For text in italic.
- `bold`: For text in bold.
- `bold.italic`: For text both in italic and bold.

Value

A ggplot2 object with a Waffle Plot.

Examples

```
# Check Suggests.
value <- SCpubr:::check_suggests(function_name = "do_WafflePlot", passive = TRUE)

if (isTRUE(value)){
  # Consult the full documentation in https://enblacar.github.io/SCpubr-book/
  # Define your Seurat object.
  sample <- readRDS(system.file("extdata/seurat_dataset_example.rds", package = "SCpubr"))

  # Basic Waffle plot.
  p <- SCpubr:::do_WafflePlot(sample = sample,
                                group.by = "seurat_clusters")

} else if (base:::isFALSE(value)){
  message("This function can not be used without its suggested packages.")
  message("Check out which ones are needed using `SCpubr::state_dependencies()`")
}
```

human_chr_locations *Chromosome arm locations for human genome GRCh38.*

Description

A tibble containing the chromosome, arm and start and end coordinates.

Usage

```
data(human_chr_locations)
```

Format

A tibble with 48 rows and 4 columns:

chr Chromosome.

arm Chromosome arm.

start Start coordinates.

end End coordinates.

Index

* datasets
