

Axes, axes, axes

Andreas Böhmann Michael Ummels

v1.0e – 2020/07/21

Abstract

The fontaxes package simulates multiple independent font selection axes on top of certain single NFSS axes: *base family*, *figure style*, and *figure alignment* on top of *family*; *primary shape* and *secondary shape* on top of *shape*; and *math weight* and *math figure alignment* on top of *math version*.

1 Introduction

The introduction of the New Font Selection Scheme (NFSS) has greatly simplified the usage of \TeX with fonts different from the Computer Modern fonts originally

designed for T_EX. However, the NFSS has some limitations. In particular, it defines only one axis for the font shape, which caters for both the actual *shape* of the font (e.g. upright, italic or slanted) and the *case* of the font (e.g. upper-lower case and small-caps). For example, if the current font shape is italic, then selecting small capitals using `\scshape` or `\textsc` will revert to an upright shape, even if the font has italic small capitals.

The `fontaxes` package alleviates the deficiencies of the NFSS by simulating multiple axes on top of single NFSS axes. In particular, it replaces the single NFSS shape axis by a primary and a secondary shape axis, catering for the shape and the case of the font, respectively. Moreover, the package introduces three new axes to deal with different *figure versions*, which are provided by many professional fonts.

2 Usage

You can load this package by adding

```
\usepackage{fontaxes}
```

to the preamble of your document. This redefines and makes available certain font selection commands, which are described in the rest of this section.

2.1 Shape

The `fontaxes` package splits the NFSS's single shape axis into two: the primary shape axis (`n`, `it`, etc.) and the secondary shape axis (`ulc`, `sc`, etc.).

`\upshape` The commands `\upshape`, `\itshape`, and `\slshape` are redefined to access the primary axis only. For access to a swash shape, the command `\swshape` has been added.

`\swshape` The commands `\scshape` and `\sscshape` (spaced small caps) access the secondary axis. To return from any small-caps shape to upper-lower case, you can use the command `\ulcshape`.

`\ulcshape` All these commands update the two shape axes using the low-level commands `\fontprimaryshape{<value>}` and `\fontsecondaryshape{<value>}`.

`\sscshape` If you want to change which values are used by the various commands `\<abbr>shape`, redefine the corresponding `\<abbr>default`. The additional commands `\swdefault`, `\sscdefault`, and `\ulcdefault` are provided with their default values `sw`, `ssc`, and `ulc`, respectively.

`\fontprimaryshape`
`\fontsecondaryshape`
`\swdefault`
`\sscdefault`
`\ulcdefault`

2.2 Figure version

Different figure versions are usually implemented as different font families (e.g. `MinionPro- $\{0sF, LF, T0sF, TLF\}$` or `pp1{j, x}`). The `fontaxes` package splits off the axes *figure style* and *figure alignment*, which leaves the *base family* (e.g. `MinionPro` or `pp1`).

| | |
|--|---|
| <code>\txfigures</code> <code>\lnfigures</code> <code>\tbfigures</code> <code>\prfigures</code> <code>\fontfigurestyle</code> <code>\fontfigurealignment</code> <code>\fontbasefamily</code> | <p>The fontaxes package knows two figure styles, text and lining (accessible via <code>\txfigures</code> and <code>\lnfigures</code>), and two modes of figure alignment, tabular and proportional (accessible via the switches <code>\tbfigures</code> and <code>\prfigures</code>).</p> <p>Additionally, you can access both axes directly using the low-level commands <code>\fontfigurestyle{<value>}</code> and <code>\fontfigurealignment{<value>}</code>.</p> <p>If you want to change the font family without changing the figure version, use <code>\fontbasefamily{<value>}</code>. (All <code>\font...</code> commands require a successive <code>\selectfont</code> to make the changes take effect.)</p> <p>For choosing the figure versions to be used in math mode, you can use the corresponding axis <i>math figure alignment</i>. Note that there is currently no means for changing the figure style used in math.</p> |
|--|---|

2.3 Math version

| | |
|--|--|
| <code>\boldmath</code> <code>\unboldmath</code> <code>\tabularmath</code> <code>\proportionalmath</code> <code>\mathweight</code> <code>\mathfigurealignment</code> | <p>By default, \TeX provides two math versions, normal and bold, as well as commands <code>\boldmath</code> and <code>\unboldmath</code> for switching between them. The fontaxes packages redefines these commands to operate on the axis <i>math weight</i>.</p> <p>A second axis <i>math figure alignment</i> is introduced that allows you to switch between tabular and proportional figures using <code>\tabularmath</code> and <code>\proportionalmath</code>. (This assumes the presence of additional math versions <code>tabular</code> and <code>boldtabular</code>; the package will copy the setups of math versions <code>normal</code> and <code>bold</code> at the end of the preamble in case you do not provide your own declarations.)</p> <p>You can directly assign values to the axes using the low-level commands <code>\mathweight{<value>}</code> and <code>\mathfigurealignment{<value>}</code>.</p> <p>Table 1 summarizes which commands set which values on which axes.</p> |
|--|--|

2.4 Additional commands

| | |
|--|---|
| <code>\textsw</code> <code>\textssc</code> <code>\textulc</code> <code>\textfigures</code> <code>\liningfigures</code> <code>\tabularfigures</code> <code>\proportionalfigures</code> <code>\figureversion</code> | <p>Similar to the well-known <code>\textit</code>, <code>\textsc</code>, etc. this package provides commands <code>\textsw</code>, <code>\textssc</code>, <code>\textulc</code>, <code>\textfigures</code>, <code>\liningfigures</code>, <code>\tabularfigures</code> and <code>\proportionalfigures</code> that take one argument and apply the font change only to the argument. For example, <code>\textsw{<text>}</code> is roughly equivalent to <code>{\swshape<text>}</code> (but automatically adds italic corrections).</p> <p>The command <code>\figureversion{<options>}</code> allows easy switching of multiple aspects of figures simultaneously. It takes as an argument a comma-separated list of one or more of the following options:</p> |
|--|---|

| | |
|---------------------------------|---------------------------|
| <code>text, osf</code> | for text figures, |
| <code>lining, lf</code> | for lining figures, |
| <code>tabular, tab</code> | for tabular figures, |
| <code>proportional, prop</code> | for proportional figures. |

For example, `\figureversion{lf, tab}` selects tabular lining figures.

Table 1: Summary of commands

| Command | Axis | Value | Default |
|-----------------------------------|-----------------------------------|---------------------------------------|---------|
| <code>\upshape</code> | <code>\fontprimaryshape</code> | <code>\updefault</code> | n |
| <code>\itshape</code> | | <code>\itdefault</code> | it |
| <code>\slshape</code> | | <code>\sldefault</code> | sl |
| <code>\swshape</code> | | <code>\swdefault</code> | sw |
| <code>\ulcshape</code> | <code>\fontsecondaryshape</code> | <code>\ulcdefault</code> | ulc |
| <code>\scshape</code> | | <code>\scdefault</code> | sc |
| <code>\sscshape</code> | | <code>\sscdefault</code> | ssc |
| <code>\txfigures</code> | <code>\fontfigurestyle</code> | text | |
| <code>\lnfigures</code> | | lining | |
| <code>\tbfigures</code> | <code>\fontfigurealignment</code> | tabular | |
| <code>\prfigures</code> | | proportional | |
| <code>\langle none \rangle</code> | <code>\fontbasefamily</code> | <i>\langle font-dependent \rangle</i> | |
| <code>\boldmath</code> | <code>\mathweight</code> | bold | |
| <code>\unboldmath</code> | | normal | |
| <code>\tabularmath</code> | <code>\mathfigurealignment</code> | tabular | |
| <code>\proportionalmath</code> | | proportional | |

3 Implementation

3.1 High-level author commands (Level 1)

3.1.1 Shape

```

\upshape Axis 1: primary shape
\itshape 1 \(*package)
\slshape 2 \DeclareRobustCommand\upshape{\not@math@alphabet\upshape\relax
\swshape 3 \fontprimaryshape\updefault\selectfont}
4 \DeclareRobustCommand\itshape{\not@math@alphabet\itshape\mathit
5 \fontprimaryshape\itdefault\selectfont}
6 \DeclareRobustCommand\slshape{\not@math@alphabet\slshape\relax
7 \fontprimaryshape\sldefault\selectfont}
8 \DeclareRobustCommand\swshape{\not@math@alphabet\swshape\relax
9 \fontprimaryshape\swdefault\selectfont}

\scshape Axis 2: secondary shape
\sscshape 10 \DeclareRobustCommand\scshape{\not@math@alphabet\scshape\relax
\ulcshape 11 \fontsecondaryshape\scdefault\selectfont}
12 \DeclareRobustCommand\sscshape{\not@math@alphabet\sscshape\relax
13 \fontsecondaryshape\sscdefault\selectfont}
14 \DeclareRobustCommand\ulcshape{\not@math@alphabet\ulcshape\relax
15 \fontsecondaryshape\ulcdefault\selectfont}

```

`\noscsshape` Provide an alias for compatibility with the `slantsc` package.

```
16 \let\noscsshape\ulcshape
```

`\swdefault`

```
\ulcdefault 17 \providecommand\swdefault{sw}
```

```
\sscdefault 18 \providecommand\ulcdefault{ulc}
```

```
19 \providecommand\sscdefault{ssc}
```

`\textsw`

```
\textssc 20 \DeclareTextFontCommand{\textsw}{\swshape}
```

```
\textulc 21 \DeclareTextFontCommand{\textssc}{\sscshape}
```

```
22 \DeclareTextFontCommand{\textulc}{\ulcshape}
```

3.1.2 Figure version

`\txfigures` Axis 1: figure style

```
\lnfigures 23 \def\txfigures{\@nomath\txfigures
```

```
24 \fontfigurestyle{text}\selectfont}
```

```
25 \def\lnfigures{\@nomath\lnfigures
```

```
26 \fontfigurestyle{lining}\selectfont}
```

`\tbfigures` Axis 2: figure alignment

```
\prfigures 27 \def\tbfigures{\@nomath\tbfigures
```

```
28 \fontfigurealignment{tabular}\selectfont}
```

```
29 \def\prfigures{\@nomath\prfigures
```

```
30 \fontfigurealignment{proportional}\selectfont}
```

`\figureversion` This code originally appeared in the package `MinionPro`. We have adapted it to work within `fontaxes`' framework and also changed some option names.

```
31 \newcommand\fontaxes@fv@prefix{fontaxes@fv@switch@}
```

```
32 \newcommand*\fontaxes@fv@newoption[1]{%
```

```
33 {\expandafter\newcommand\csname\fontaxes@fv@prefix #1\endcsname}
```

```
34 \fontaxes@fv@newoption{text}{\txfigures}
```

```
35 \fontaxes@fv@newoption{osf}{\txfigures}
```

```
36 \fontaxes@fv@newoption{lining}{\lnfigures}
```

```
37 \fontaxes@fv@newoption{lf}{\lnfigures}
```

```
38 \fontaxes@fv@newoption{tabular}{\tbfigures\tabularmath}
```

```
39 \fontaxes@fv@newoption{tab}{\tbfigures\tabularmath}
```

```
40 \fontaxes@fv@newoption{proportional}{\prfigures\proportionalmath}
```

```
41 \fontaxes@fv@newoption{prop}{\prfigures\proportionalmath}
```

We simply iterate over the list of figure versions specified in the argument to `\figureversion` and check if we have specified a matching option.

```
42 \newcommand\fontaxes@fv@list{}
```

```
43 \newcommand\fontaxes@fv{}
```

```
44 \DeclareRobustCommand*\figureversion[1]{%
```

```
45 \edef\fontaxes@fv@list{\zap@space#1 \@empty}%
```

```
46 \@for\fontaxes@fv:=\fontaxes@fv@list\do{%
```

```
47 \ifundefined{\fontaxes@fv@prefix\fontaxes@fv}{%
```

```

\fontaxes@naming@exception To do: Add a user interface to specify naming exceptions.

```

223 \newcommand*\fontaxes@naming@exception[3]{%
224 \expandafter\edef\csname fontaxes@encode@#1#2\endcsname{#3}%
225 }

```

The following alias is defined for compatibility with package files generated by autoinst.

```

226 \let\fa@naming@exception\fontaxes@naming@exception

```

The defaults `n` and `ulc` disappear when combined.

```
227 \fontaxes@naming@exception{shape}{n}{ulc}{n}
228 \fontaxes@naming@exception{shape}{n}{sc}{sc}
229 \fontaxes@naming@exception{shape}{n}{ssc}{ssc}
230 \fontaxes@naming@exception{shape}{it}{ulc}{it}
231 \fontaxes@naming@exception{shape}{sl}{ulc}{sl}
232 \fontaxes@naming@exception{shape}{sw}{ulc}{sw}
```

The defaults disappear in the concatenation. `boldtabular` is formed regularly.

```
233 \fontaxes@naming@exception{math}{normal}{proportional}{normal}
234 \fontaxes@naming@exception{math}{normal}{tabular}{tabular}
235 \fontaxes@naming@exception{math}{bold}{proportional}{bold}
```

Provide abbreviations for font family suffixes.

```
236 \fontaxes@naming@exception{figures}{text}{proportional}{OsF}
237 \fontaxes@naming@exception{figures}{text}{tabular}{TOsF}
238 \fontaxes@naming@exception{figures}{lining}{proportional}{LF}
239 \fontaxes@naming@exception{figures}{lining}{tabular}{TLF}
```

The `j/x` naming convention does not know about different figure alignments; let us silently ignore these.

```
240 \fontaxes@naming@exception{figuresalt}{text}{proportional}{j}
241 \fontaxes@naming@exception{figuresalt}{text}{tabular}{j}
242 \fontaxes@naming@exception{figuresalt}{lining}{proportional}{x}
243 \fontaxes@naming@exception{figuresalt}{lining}{tabular}{x}
```

3.5 Decoding

Detect if `\mathversion`, `\fontshape`, `\fontfamily` have been used not under control of this package.

```
\fontaxes@figure@style@domain Assuming an injective encoding function, we can construct decoding tables when
\fontaxes@figure@align@domain we know the function's domain. To do: Warn if decoding entries are overwritten
  \fontaxes@shape@one@domain (if the function is not injective).
```

```
  \fontaxes@shape@two@domain 244 \newcommand*\fontaxes@figure@style@domain{text,lining}
\fontaxes@math@weight@domain 245 \newcommand*\fontaxes@figure@align@domain{proportional,tabular}
  \fontaxes@math@align@domain 246 \newcommand*\fontaxes@shape@one@domain{n,it,sl,sw}
247 \newcommand*\fontaxes@shape@two@domain{ulc,sc,ssc}
248 \newcommand*\fontaxes@math@weight@domain{normal,bold}
249 \newcommand*\fontaxes@math@align@domain{proportional,tabular}
```

```
\fontaxes@create@decode@table #1 name, #2 list of axes
250 \newcommand*\fontaxes@create@decode@table[2]{%
251   \begin{group}
252   \fontaxes@foreach{#2}{%
253     \@nameuse{fontaxes@encode@#1}%
254     \global\expandafter
255     \edef\csname fontaxes@decode@#1{\fontaxes@code}\endcsname{#2}%
256   }%
```

```

257 \endgroup
258 }
259 \AtEndOfPackage{
260 \fontaxes@create@decode@table{figures}
261   {\fontaxes@figure@style}{\fontaxes@figure@align}}
262 \fontaxes@create@decode@table{figuresalt}
263   {\fontaxes@figure@style}{\fontaxes@figure@align}}
264 \fontaxes@create@decode@table{shape}
265   {\fontaxes@shape@one}{\fontaxes@shape@two}}
266 \fontaxes@create@decode@table{math}
267   {\fontaxes@math@weight}{\fontaxes@math@align}}
268 }
\fontaxes@warn@undecodable
269 \newcommand*\fontaxes@warn@undecodable[1]{%
270 \PackageWarning{fontaxes}{I don't know how to decode\MessageBreak #1}}

```

`\fontaxes@decode@` Interpret the decoding tables.

```

271 \newcommand*\fontaxes@decode@[2]{%
272 \ifundefined{fontaxes@decode@#1{#2}}{%
273 \let\fontaxes@edoc\relax
274 \fontaxes@warn@undecodable{#1 '#2'}%
275 }{\edef\fontaxes@edoc{\@nameuse{fontaxes@decode@#1{#2}}}}%
276 }

```

`\fontaxes@save` Save states of macros for future comparison.

`\iffontaxes@changed`

```

277 \newcommand*\iffontaxes@changed[1]{%
278 \expandafter\ifx\csname fontaxes@last@\string#1\endcsname#1%
279 \expandafter\@secondoftwo
280 \else
281 \expandafter\@firstoftwo
282 \fi
283 }
284 \newcommand*\fontaxes@save[1]{%
285 \expandafter\let\csname fontaxes@last@\string#1\endcsname#1%
286 }

```

3.6 Compatibility

`\fontaxes@provide@mv@copy`

Declare math version #1 to be a copy of math version #2 if #1 does not exist already. To accomplish this, we have to know that a math version's configuration is basically stored in a macro `\mv@<name>` (which makes us dependent on the NFSS implementation; sigh ...).

```

287 \newcommand*\fontaxes@provide@mv@copy[2]{%
288 \ifundefined{mv@#1}{%
289 \DeclareMathVersion{#1}%
290 \expandafter\let\csname mv@#1\expandafter\endcsname
291 \csname mv@#2\endcsname

```

```

292  }{}%
293 }

```

If no math versions `tabular` and `boldtabular` are defined in the preamble, we provide defaults by copying the states of normal and bold (assuming, in turn, that these two exist).

```

294 \AtBeginDocument{%
295   \fontaxes@provide@mv@copy{tabular}{normal}%
296   \fontaxes@provide@mv@copy{boldtabular}{bold}%
297 }

```

3.7 Tools

`\fontaxes@check@family` Check if family switching would yield an existing shape.

```

\iffontaxes@exists 298 \newif\iffontaxes@exists
299 \newcommand*\fontaxes@check@family[1]{%
300   \begingroup
301   \fontfamily{#1}\try@load@fontshape
302   \expandafter
303   \ifx\csname\curr@fontshape\endcsname\relax
304     \aftergroup\fontaxes@existsfalse
305   \else
306     \aftergroup\fontaxes@existstrue
307   \fi
308   \endgroup
309 }

```

`\fontaxes@split@prefix` The results of splitting a family name.

```

\fontaxes@split@suffix 310 \newcommand*\fontaxes@split@prefix{}
311 \newcommand*\fontaxes@split@suffix{}

```

`\fontaxes@split@family` Font name contains one hyphen; split there.

```

312 \newcommand*\fontaxes@split@family{}
313 \def\fontaxes@split@family#1-#2-#3\@nnil{%
314   \let\fontaxes@split@prefix\relax
315   \let\fontaxes@split@suffix\relax
316   \def\@tempa{#3}%
317   \ifx\@tempa\@empty\else
318     \def\fontaxes@split@suffix{#2}%
319     \ifx\fontaxes@split@suffix\@empty
320       \let\fontaxes@split@suffix\relax
321     \else
322       \def\fontaxes@split@prefix{#1}%
323     \fi
324   \fi
325 }

```

`\fontaxes@split@familyalt` Name consists of four characters; split off the last one. If there are just three characters, the default suffix is ‘x’.

```

326 \newcommand*\fontaxes@split@familyalt{}
327 \def\fontaxes@split@familyalt#1#2#3#4#5\@nnil{%
328   \let\fontaxes@split@prefix\relax
329   \let\fontaxes@split@suffix\relax
330   \edef\@tempa{#5}%
331   \ifx\@tempa\@empty
332     \ifx\@empty#4%
333       \def\fontaxes@split@prefix{#1#2#3}%
334       \def\fontaxes@split@suffix{x}%
335     \else
336       \def\fontaxes@split@prefix{#1#2#3}%
337       \def\fontaxes@split@suffix{#4}%
338     \fi
339   \fi
340 }

```

`\fontaxes@foreach` Execute #2 for each combination of values of the axes given in #1 (in the form `{\cs}{\cs}...`).

```

341 \newcommand\fontaxes@foreach[2]{%
342   \begingroup
343   \def\fontaxes@foreach@{#2}%
344   \@tfor\@tempa:=#1\do{%
345     \@temptokena\expandafter{\fontaxes@foreach@}%
346     \edef\fontaxes@foreach@{%
347       \noexpand\@for
348       \expandafter\noexpand\@tempa:=%
349       \expandafter\noexpand\csname
350       \expandafter\expandafter
351       \expandafter\@gobble
352       \expandafter\string\@tempa
353       @domain%
354       \endcsname
355       \noexpand\do{\the\@temptokena}%
356     }%
357   }%
358   \expandafter\endgroup\fontaxes@foreach@
359 }
360 </package>

```

3.8 Tests

The file `test-fontaxes.tex` (docstrip target `test`) exercises some features of `fontaxes`. Since it is rather ad-hoc code, it is not shown here. (It also requires the `MinionPro` package.)
